Colleges; *School Funds; *State Aid; State Colleges; State Surveys; Tax Allocation; Teacher Salaries

ABSTRACT

Information on state-level financing of higher education and on institutional revenues and expenditures is presented 🥆 for fiscal year (FY) 1982, with trend data back to FY 1978. In addition to a narrative analysis, nearly 200 tables show state rankings on 46 factors involved in higher education finance. The state rankings cover state and local government finances, support of colleges and student financial aid, enrollment trends, and other trend data. Each eight-page state profile provides a commentary on state conditions and trends and data on: state financing of higher education; revenues and expenditures of specific types of public and private colleges; trends in state and local appropriations, revenues, tuition and fees, and enrollment; trends adjusted for inflation; faculty salaries by academic rank and institutional category; and institutional characteristics by type of college. Included is data on the state's tax structure, state and local finances per capita, and expenditures for seven basic public programs. Information on population and enrollments covers state access rates, interstate migration of students, enrollment mix by institutional sector, and student attendance patterns. Appended are a listing of institutions by classification, control, and state, and definitions and information on data sources. (SW)

FOREWORD

William P. Gerberding
President
University of Washington
Seattle, Washington

Decisionmaking of all kinds has always been dependent on the quality of the information available. It may be, for example, that most wars have occurred because of poor information or misinformation, not irreconcilable conflicts of interest which justify hostilities.

In the computer age, all of us are inundated by data. Some it is useful, even essential, to sound decisionmaking. Much of it is of marginal or no utility. This proliferation of information makes vitally important the work of persons who can arrange and display it usefully. Marilyn McCoy and Kent Halstead have sorted through the volumes of statistics available through the HEGIS data collection system in order to provide us in higher education with information of great importance for budgetary decisions.

Comparisons among states provide institutions and state governments with a yardstick against which their own progress or decline can be measured. Changes in levels of funding implicitly or explicitly constitute changes in policy. These changes in funding levels should be known, and this study provides this information.

This fourth edition of Higher Education Financing in the Fifty States is much improved over previous versions in content, in format, in accuracy, and in timeliness. Nevertheless, because of the complexity and inconsistency of higher education funding systems among the states, there continues to be room for improvement. The study's

focus at the state and national levels is appropriate and should be continued, but further efforts need to be made to assure data comparability and to improve data classification. The present method of classification, for example, lumps together into the category of "research universities with medical programs" all institutions which possess either a medical or a veterinary program. The organizational and financial characteristics of such programs are clearly very different and should be classified accordingly.

Anomalies of this sort are used in arguments against the publication of studies of this kind. While it is true that the lack of uniformity among the states in funding methods does undermine to some extent the utility of the data provided for comparative analysis, it is nonetheless true that if we exercise due caution the data presented here can be useful in allowing us to view our own state and institutional policies within the context of national trends.

The progress the authors have made in refining the data and providing us with a relatively clear picture of higher education funding levels throughout the nation is commendable, and the decisions we make at the state and institutional levels on the allocation of resources should be better because of it.

xiii

This report was jointly sponsored by the National Center for Higher Education Management Systems (NCHEMS) and the 'National Institute of Education (NIE). We acknowledge with thanks their financial support and professional encouragement. The data were provided primarily by the National Center for Education Statistics (NCES), and the improved quality and timeliness of the NCES data tapes were an essential building block for the study. In addition, staff at many state higher education coordinating/governing boards were extremely helpful in reporting information on the type and extent of unusual funding and operating arrangements in their states.

Credit and thanks for the programming of the analyses for this report are due primarily to Jay Atwater and Kaye Kriz.

Special thanks are due Melodie Christal at NCHEMS, who provided the internal supervision for the project in all phases. Her efforts in coordinating tasks, editing data, preparing and checking tabulations from the state surveys, and proofing copy are much appreciated. Her care and diligence in these arenas added measurably to the study.

Clara Roberts has again provided essential leadership in the printing and production of the book. The authors also wish to acknowledge the excellent editing provided at NCHEMS by Mary Hey and Rolf Norgaard.

To Paula Dressler, we extend a very special thank you for her exceptional skill and many hours of effort in once again typing and compiling this study. Her capacity to carefully transform drafts to copy is unmatched. Her cheer and good will were always appreciated. Her help in coordinating all stages of document development were key in finalizing this work.

We also want to especially thank Paul Brinkman, Dennis Jones, and William Tetlow for their help in supporting this study and insuring its completion.

This is the fourth edition of Higher Education Financing in the Fifty States (earlier editions were for FY81, FY79, and FY76). This work has evolved from earlier work by both authors. Kent Halstead, in Statewide Planning in Higher Education (1974), identified the selected indexes related to higher education financing and the socioeconomic status of states that are used in this study. His work on measures of tax capacity, tax effort, and tax revenues is now updated regularly by the Advisory Council on Intergovernmental Relations. Also, the adjustments for inflation found in this book are based on his annual Higher Education Price Index (HEPI). Marilyn McCoy, in her work with the Statewide Analysis Task Force at NCHEMS (which included Halstead) and a subsequent panel of experts, developed the basic data system and framework used in this report. The members of those groups provided invaluable suggestions and comments in the evolution of the predecessor of this study State and Local Financial Support of Higher Education 1973-74, and an even earlier version for 1972-73.

It is intended that this study be updated regularly. Recommendations for improvement in format or analysis are therefore encouraged.

SPECIAL NOTE

In the development of this report, NCHEMS has constructed a specialized data base drawing upon tapes and other published material from the National Center for Education Statistics and the U.S. Census Bureau, among others. In this report, summary data for ten categories of public and independent institutions are displayed for each of the fifty states and the District of Columbia. Similar reports by institution can be developed from this data base. In addition, other reports, including custom-designed reports, can be generated by NCHEMS Information Services on a cost-recovery basis. The five major categories of information available include revenues and expenditures, enrollment, faculty, programs, and research and development. For further information about NCHEMS Information Services, contact Craig Short at NCHEMS, P.O. Drawer P, Boulder, Colorado 80302, or telephone 303-497-0319.

XV

IMPORTANT CAUTIONS TO THE READER

The following precautions and explanations are provided to give readers a perspective for their reading and to prevent any misuse of the data presented in this edition.

The data presented here are for fiscal year (FY) 1982, with trend data back to FY 1978. This information is over two years old. It is mainly useful as background for understanding the mix of factors that are important in a specific state (the relative reliance on public education, the tax structure, the mix of institutions in the state). The data should either be updated or the continuation of relative relationships verified if the data are to be used in current decisionmaking regarding appropriation levels, formula funding, or the establishment of financial profiles.

In developing this study, and through review of earlier work in the field, a number of data comparability problems were identified. These problems mandate that care be taken in making interstate comparisons of certain measurements. These comparability problems are discussed in general in section 2 of appendix B and should be studied prior to reading any individual state's profile. In an effort to identify data comparability problems or other necessary clarifications, the higher education finance officers in each state are consulted, and their comments are included in the "Data Notes" section with each state's profile.

Similarly, caution is advised for those who would compare the data in this study to the data in previous editions. In particular, while totals for the public and private sectors are compatible across editions, the data by institutional type may not be, because individual institutions may be classified differently from one edition to the next.

Variations in the way states report data in postsecondary education underlie our concern regarding comparability. For example, in some states, the vocational education system is included within higher education; in others, it is a component of elementary/secondary education. Similarly, medical schools are organized and reported as separate campuses in some states, in others, they are integrated with a university. To address this particular difference, research universities and other universities are separately categorized as medical and nonmedical to indicate the existence of programs in medicine. veterinary medicine, osteopathic medicine, and dentistry within these sectors. Different state practices for capital expenditures, retirement-system payments, student aid, and for counting enrollment also contribute to comparability problems. Such problems are noted in the Data Notes section for each state. Finally, the significance of the counts of faculty vary by sector. For instance, the reliance on full-time faculty (reported here) is relatively low in the two-year sector. The reader should take this into account when interpreting data using this factor.

Proper interpretation and assessment of financing higher education requires study of each state's entire data presentation. Isolation of a single measure or attention to a limited segment is likely to be misleading. For example, it is currently popular to focus on state appropriations per capita, a measure that ignores the different needs for funding represented by enrollment levels, the varying taxing ability of states, different strategies for utilizing tuition versus appropriations, and numerous other factors that determine and usually justify variations in per capita support.

There is no "ideal" funding pattern recommended or implied in this study, nor should good or bad connotations be attached to state rankings. States differ so greatly that many funding strategies can be considered sound.

Financing higher education is a difficult and complex process. Readers are urged to become thoroughly familiar with their state's entire financial picture before attempting evaluation of any specific operating level. The study (like the second and third editions) is more comprehensive than previous work of this type, as it introduces such factors as student migrations and different enrollment patterns, state and local government tax capacity and effort, the structure of the public higher education system, and institutional revenue and expenditure details. Yet there are voids that can be filled only with locally supplied data. Thus, information should be introduced into the analysis by knowledgeable state and local officials regarding geographical price differences, costly versus less costly academic programs, economies of scale, competition for state monies and traditional funding priorities, history of taxation, specialized accounting practices, and the role of the private sector.

The breadth of information required for sound funding decisions suggests that many different points of view about higher education should be taken into consideration. It is therefore recommended that in the analysis and interpretation of this study, the reader should consuit and take into account the perspectives of postsecondary institutions, state commissions, the legislative and executive branches, the general public, and student clientele.

XVII

BEST COPY

Recognizing that important budget decisions and resource allocations may be influenced by this study, and that valid comparative procedures are critically needed, the authors request your constructive commentary on the study design and statistical detail. Please send your comments to the authors in care of NCHEMS, P.O. Drawer P, Boulder, Colorado 80302.

CHAPTER 1: INTRODUCTION AND GENERAL TRENDS

Summary Findings

The fourth edition of this report updates the profile of higher education funding in the states to fiscal year 1982. Although much of the information in the ensuing pages describes fiscal and related conditions in the states for FY82, major funding and enrollment trends for the fiscal period 1978 to 1982 are also presented. Individual year data for FY82, FY81, and FY80 are also displayed to provide a context for conditions in FY82.

For two-thirds of the states, FY82 represented another year of retrenchment. Although state and local appropriations for public higher education were increased by 8. 5 percent, after adjustments for inflation (estimated at 10.0 percent, using the Higher Education Price Index) and for a 2. 3 percent increase in enrollments, there was a net 3.6 percent decrease per student in constant dollars. (The 8.5 percent increase in state appropriations for higher education in FY82 reflected an overall growth in state budgets.) Thirty-four states had losses in net funding, ranging from a nearly one-third loss (32. 2 percent) in Wyoming to losses of less than I percent in four states (North Dakota, Kansas, Georgia, and Maryland). Seven other states besides Wyoming had losses that were 10 percent or more, including Washington (14. 7 percent), Missouri (14. 6 percent), the District of Columbia (12.9 percent), California (12. 0 percent), Alabama (11. 6 percent), South Carolina (10. 5 percent), and Illinois (10.0 percent). Sixteen states showed improvements in state funding per student in constant dollars: Texas (11. percent), Montana (10. 8 percent), Oklahoma (6. 1 percent), Tennessee (4. 9 percent), Utah (4. 5 percent), Hawaii (3. 7 percent), Minnesota (3. 1 percent), Vermont (2. 9 percent), New York (2. 6 percent), Colorado (2. 4 percent), Florida (2. 4

, percent), Arizona (2. 2 percent), Oregon (2. 0 percent), Delaware (1. 6 percent), Massachusetts (1. 2 percent), and New Mexico (. 6 percent).

Losses in the value of state funding made FY82 the third year in a row in which some erosion in funding support occurred, after adjustments for inflation and enrollment. In FY81, there was a similar loss (3. 7 percent in constant-dollar appropriations per public student), which followed an FY80 loss of 1.0 percent. Between 1978 and 1982, the average decrease in constant-dollar appropriations per student was 5. 3 percent, but again losses of magnitude were widespread. Thirty-five states were unable to cover the inflation rate of 44. 3 percent and enrollment gains that averaged 5.6 percent.

All categories of public institutions suffered losses except the health-professional and other professional and specialized schools. The health-professional sector showed a 7.0 percent gain in the value of state monies per student. The other professional and specialized schools fared even better, realizing a net gain in appropriations of 15. 1 percent. In general, losses were most pronounced in the two-year sector, with the academic/comprehensive two-year institutions facing an 11.5 percent decline in state appropriations per student in constant dollars, and the occupational two-year schools encountering a 7.3 percent loss. Losses for the universities were generally around 5 percent; losses at comprehensive institutions were 2.4 percent, and those at baccalaureates were 4.7 percent.

Tuition revenues kept pace with inflation and enrollments in FY82, netting a 1.9 percent increase per student in constant dollars. Still, the drop in state support was decisive, and overall, the net operating budgets of public institutions (excluding government grants and contracts) shrank 2. 0 percent in FY82. As these figures demonstrate, 1982 was a year of general retrenchment in the financial capacities of ' public higher education. The losses in net state funding in FY82, FY81, and FY80 were reflected in decreases in total operating revenues for those years of 2.0, 2.9, and . 5 percent respectively. The four-year loss (FY78 to FY82) in total operating funds (excluding government grants and contracts) amounted to 2.3 percent, and all public sectors were affected except the health-professional and other professional and specialized schools.

By contrast, the fiscal capacities of the private sector improved in each of these years as well as for the four-year period (FY-78 to FY82). On average there was a 13.7 percent real gain in the budgets of the independent sector, prompted in large measure by a 2.8 percent improvement in tuition funds. All but one sector (the two-year occupational schools) showed improvements in total E&G revenues.

Although there was no major realignment of funding sources during this period, some small shifts were visible. In both the public and independent sector, tuition revenues increased while income from government grants and contracts shrank proportionally. In the public sector, gains in tuition compensated for the reductions in state funding support to some degree.

Faculty salaries lost ground to inflation during the FY78 to FY82 period; although salaries increased by 36 percent in both the public and private sectors, CPI increases amounted to 50. 2 percent. An increase in the average size of both public and private institutions helped in economizing, but the

ERIC
Full Text Provided by ERIC

increase in the share of enrollments in both sectors at the graduate level served to increase expenses.

Appropriations Per Capita

Alaska led the nation in its support of higher education in 1982 by providing \$367 per capita, a level nearly three and one-half times the U.S. average of \$108 per capita. Arizona was next in its level of support at \$165, followed by Hawaii at \$163, North Dakota at \$154, and California at \$151. New Hampshire spent only \$40 per capita on higher education, the least of any state; it was followed by Vermont at \$64, Pennsylvania at \$66, Massachusetts at \$67, Maine at \$68, and Ohio at \$69. Other measures of need--enrollment load, expensiveness of the higher education system, contributions from other sources--must be considered in order to accurately determine the adequacy of state funding. Thus, the state rankings contained in tables 1 through 3 should be used only as indications of the amounts that states appropriated to higher education, and of how the money was allocated between student aid and institutional appropriations.

State and Local Student Aid

, In 1982, 41 states supported higher education through student aid, averaging \$4. 20 per capita. Far above that average and leading the nation was Alaska, providing \$66.60 per capita in student aid. New York was in 2nd place, with \$16.80 per capita but still a level four times greater than the national average. Vermont was 3rd, with \$10.50, followed by Illinois with \$7.80 and Minnesota with \$7.70 per capita. Thirty-four states provided support to students attending public institutions, and 33 states provided aid to students attending independent institutions; but students at public institutions received a smaller share, 38 percent, of total state student-aid funds.

State student aid totaled nearly \$963 million in 1982, an 11.6 percent increase over 1981 levels. Nonetheless, student aid still represented only 4 percent of the total higher education support provided by states. Traditionally, student aid has been the province of the federal government, and the figures in this study indicate that while state student aid is growing, the states still have a relatively minor role.

Appropriations to Institutions

Over 90 percent of state funds allocated to higher education went directly to institutions. On average, the states spent \$99 per capita in 1982 for institutional support, and almost all of those funds went directly to public institutions. On average, states provided only \$1.20 per capita to independent institutions, and only 28 states--led by New York at \$6.20 per capita and Pennsylvania at \$3.80 per capita--provided such funding. Surprisingly, Massachusetts, the state with the largest number of state residents enrolled in independent institutions, ranked very low in the amount of support to institutions in the independent sector. New York, with the second-largest number of residents at independent institutions, led the nation in institutional support to the independent sector (see tables 2c and 3c). When this support and the large student aid program for the independent sector are combined, New York led the nation in state support of the private sector.

State Tax Base and Budgets

There are major disparities between the states in the extent of taxable wealth. The typical rate of taxation in 1981 yielded \$1,030 per capita, but Alaska, the state with the greatest capacity to tax (\$3,333 per capita), had more than three times the resources of Mississippi, the poorest state (with a capacity of only \$738 per capita). When a representative-tax-system measure was applied, the ten wealthiest states in tax

capacity were Alaska with \$3,333. Wyoming with \$2,228, Nevada with \$1,524, Texas with \$1,360, Oklahoma with \$1,311, North Dakota with \$1,271. Louisiana with \$1,201, California with \$1.186. New Mexico with \$1,170, and Montana with \$1,169; the ten poorest states were Mississippi with \$738, Alabama with \$767, South Carolina with \$774, Tennessee with \$813, Maine with \$816, North Carolina with \$819, Rhode Island with \$828, Georgia with \$838, Arkansas with \$840, and Kentucky with \$844. In recent years, the states have become acutely aware of the value of energy-related resources in determining their economic circumstances. Since this measure of tax capacity did not include mineral reserves, only extractions, the wealth of such states as Texas, Alaska, Louisiana, North Dakota, Wyoming, and Colorado was probably understated.

Table 4 shows the relative positions of the states in tax capacity, table 5 shows their utilization of this capacity (tax effort), and table 6 shows the resulting revenues they raise. As these rankings make clear, the states vary in both their inherent wealth and their willingness to tax. Alaska, with the largest capacity (based on such things as combined economic strength in sales, property, income, and severance-related taxes), also had an extremely high tax effort (85 percent above average) and collected tax revenues that were almost six times the U.S. average. Wyoming, by contrast, is the second wealthiest in taxable capacity, but its tax rates are among the lowest (27 percent below the average)--yet because of its wealth, it still ranked 3rd in overall tax revenues collected. Mississippi, with the lowest tax capacity, taxed at a rate just 5 percent below the national average; yet it still ranks near the bottom in revenues because of its inherent lack of wealth. States highly taxed during this period included Alaska (85 percent above average), New York (71 percent above average), the District of Columbia (46

percent above average), Massachusetts (34 percent above), Rhode Island (30 percent above), and Hawaii (26 percent above). Table 5 provides these tax rates.

States also varied substantially in how they utilized state revenues. The typical state budget in 1982 provided 26 percent for elementary/secondary education, 13 percent for welfare, 12 percent for public services, 10 percent for higher education, 9 percent for health and hospitals, 8 percent for highways, and the remaining 23 percent for a variety of other state functions. Higher education and public services increased their share of state budgets in FY 82 compared to the previous year, while elementary/secondary education and highways received less. Individual states have markedly different priorities. Table 10a shows the total level of state expenditures in 1982, based on a Census Bureau report on governmental finances. These amounts include expenditures from state tax revenues, other state funds, and federal revenue-sharing monies. Alaska spent more than any other state on public functions, \$8,673 per capita, while Arkansas spent the least, \$1,348 per capita. Utah spent the largest share of its state budget on higher education, allocating 16 percent of its funds to this use. Arizona, North Carolina, Delaware, and Oklahoma also placed a major emphasis on higher education, providing 14 to 15 percent. The District of Columbia spent the lowest share on higher education, only 3. 1 percent of its budget. Massachusetts also ranked low in this category, spending only 4. 7 percent of its budget on higher education (see table 10b). There were also important differences between the states in the budget shares allocated to elementary/secondary education. Montana, Utah, South Carolina, and Indiana all allocated more than 30 percent of their funds to elementary/secondary education. At the other end of the spectrum, the District of Columbia, Hawaii, Alaska, Delaware, Nevada, California, a:

New York assigned relatively small shares (from 15 to 23 percent).

Population and Enrollments

In the United States in 1982, the hypothetical average-size state would have had nearly 4. 5 million people, approximately 174,000 of them enrolled as full-time students. In reality, neither population nor enrollments were that evenly distributed. For instance, seven states had over 10 million people: California had 24. 2 million, New York had 17. 5 million, Texas had 14. 7 million, Pennsylvania had 11.9 million, Illinois had 11. 4 million, Ohio had 10. 8 million, and Florida had 10.2 million (see table 11). Thirteen states had fewer than 1 million people each, with Alaska and Wyoming, having fewer than 500,000 per state.

California had the largest number of students in higher education, over 1 million FTE enrollments. New York was second largest, with 764,000 students. Texas, Illinois, Pennsylvania, Ohio, Michigan, and Massachusetts also had very large student populations, between 321,000 and 536,000 each. By contrast, 14 states had enrollments below 50,000, a very small number given the average size of institutions (see table 12a).

Selection of Public or Private Institutions

On average, 76 percent of students attended public institutions. In 11 states—Nevada, Wyoming, Alaska, Utah, Arizona, New Mexico, North Dakota, Hawaii, Montana, Delaware, and Mississippi—90 percent or more of the students were in public institutions. This high concentration of students in public institutions created a concomitant need for additional public support for higher education. In comparison, those states with greater reliance on independent institutions for the education of their populace needed less public support. (Tables 12b and 12c

provide rankings of the states in public and independent enrollments.) The District of Columbia was almost entirely private in enrollment, with 88 percent of students in such institutions. Massachusetts followed closely behind, with 60 percent of the students (not all state residents) enrolled in independent institutions.

Relative Access Levels among the States

An important enrollment indicator, provided in table 13a, shows the relative access achieved by residents of the 50 states. Arizona and Massachusetts led the nation in access for residents, with the result that people in those two states were respectively 27 and 23 percent more likely to attend institutions of higher education than was the average U.S. resident. Access for Massachusetts residents is particularly noteworthy given that state's low level of financial support to higher education and its substantial reliance on independent education. Residents of the state clearly valued higher education, but they chose either to pay for it directly in the form of tuition or to attend institutions that were often inadequately supported, in comparative terms.

In Massachusetts, New York, the District of Columbia, Pennsylvania, Rhode Island, Illinois, Iowa, and Connecticut, in particular, large numbers of state residents attended independent institutions within the state (see table 13c). In Connecticut, New Jersey, Alaska, and the District of Columbia, large numbers of state residents (at least twice the usual number) chose to go out of state to attend institutions of higher education (see table 13d).

ERIC Founded by ERIC

BEST COPY

Public Sector Enrollments

Arizona had the largest number of students in its public system of higher education in relative per capita terms—52 per 1,000; it was followed by North Dakota with 44 per 1,000, California with 41 per 1,000, Delaware with 39 per 1,000, and Wisconsin with 38 per 1,000 (table 21). The reasons for these enrollment rates are charted in tables 14 through 20, which trace the number of high school graduates, college choices of first-time students (both in and out of state), the extent to which students persisted in their education, and students' relative proclivities for full—or part-time study.

Independent Enrollments

On average, the independent sector in a state enrolled 9. 4 FTE students per 1,000 individuals in the state. A number of states far exceeded this average, indicating a substantial emphasis on independent education. The District of Columbia led the nation, with 86.0 FTE students per 1,000 individuals; Massachusetts was 2nd with 33.7 students per 1,000 (see table 24). In Massachusetts in particular, the extensive enrollment in the independent sector was a result of the large number of state residents in these institutions (17. 5 FTE per 1,000 out of a total of 33.7 FTE per 1,000--over 50 percent of the total). States that drew large numbers of out-of-state students to attend their private schools included the District of Columbia, Rhode Island, Massachusetts, Vermont, and New Hampshire (see table 23).

Graduate Enrollments

States vary greatly in the size and structure of their higher education systems. One

31

component that affects the need for funding is the amount of graduate education required in the state. On average, 9 percent of public enrollments in the United States are at the graduate level. Leading the nation, lowa, Kansas, Indiana, New Mexico, Georgia, and Louisiana had 12 percent of their students studying at the graduate level; next were Kentucky, Minnesota, Connecticut, West Virginia, Ohio, Nebraska, and Texas, which had 11 percent of their enrollments at this level. By contrast, New Hampshire's, Alaska's, and Maine's public systems were almost entirely undergraduate, with only 5 percent of the students at the graduate level. Similarly, Massachusetts, Montana, California, the District of Columbia, Nev da, Florida, Delaware, and North Dakota were relatively low in graduate emphasis, with only 6 percent of public students at this. level. Given the relative expensiveness of graduate-level study, these ratios translate into greater or lesser needs for state and other forms of financial support. Tables 25a-f chart these differences between the states, in total and by selected types of institutions.

Public Institutional Finances

At public colleges and universities, state and local appropriations are the most important source of funds, representing 59 percent of the E&G revenues received by those institutions. Tuition and fees are next in importance, accounting for 17 percent of funds, followed by government grants and contracts with 13 percent. Because of the centrality of funding from these sources, rankings of the states are provided by source and class of institution, in tables 26a-k, 27a-k, 28a-k, and 29a-e. Tables 53a-e show rankings of the states by percentage share contributed by major revenue sources.

State and Local Appropriations per Student

In 1982, the average state provided \$3,327 per student for public higher education institutional support. The amount of appropriations per student is a critical measure of state effort because it measures the state's contribution relative to the number of students being educated within its public system. As is evident in tables 26a-k, the states vary considerably in their support of public students, both in total and by category of institution. Alaska led the nation, providing \$10,719 per student, and was followed by the District of Columbia, \$6,954; Hawaii, \$4,349; Texas, \$4,157; and Iowa, \$4,061. New Hampshire provided the least per student, \$1,753, followed by Vermont, \$1,874; Ohio, \$2,423; Massachusetts, \$2,454; and Colorado, \$2,509. More relevant indications of public-student support are provided for each category of public institution. Table 26b, for example, shows the relative support provided by states to public research universities that include medical programs in their curricula. New York led the nation in this category, providing \$9,386 for each FTE student, a level almost twice the national average of \$5,203 for students attending similar schools. Table 26f shows state distribution of support for comprehensive institutions. Alaska led the nation in this category, providing \$14,526 per student. On average, however, states typically spent \$3,116 to support students in these institutions. Rankings in state support per student for other categories of institutions are shown in tables 26a-k. In fiscal year 1982, the averages and ranges of state support levels per student by type of institution were as follows:

Categories of Institutions	U.S. Averages	High State	Low State	Ranking Table
Public, total	\$ 3,327	AK-\$10,719	NH-\$1,753	2 6a

Tuition and Fees Revenues

Tuition and fees provided a far smaller share of revenues at public institutions than at independent institutions, 17 percent versus 51 percent. However, for public institutions with tuition-setting authority, tuition and fees represent the key source of revenues for budget balancing. Typically, there is a trade-off between state appropriations and tuition, with the latter providing the residual operating capacity not covered by state appropriations. Although in 1982 the states collected, on average, \$949 per student in tuition and fees, there were substantial deviations from this norm among the states. Vermont collected the largest amount from tuition, \$3,206 per student. Tuitions for New Hampshire at \$2,240. Pennsylvania at \$1,973, Delaware at \$1,687, Ohio at \$1,643, Michigan at \$1,479, and Colorado at \$1,420 likewise provided an important source of funds, at levels 50 percent or more above national rates. By contrast, California relied less on tuition funds than any state, collecting only \$440 per student in support. Other states

collecting low tuition revenues per student included Hawaii at \$451, Texas at \$533, Oklahoma at \$534, North Carolina at \$568, the District of Columbia at \$583, Montana at \$684, and West Virginia at \$696. Table 27a provides these distributions for the public sector as a whole. Tables 27b-k provide rankings of the states for specific categories of institutions. Averages, highs, and lows in tuition and fees per student in FY 1982 by institutional group were as follows:

Categories of Institutions	U.S. Averages	High State	Low State	Ranking Table
Public, total	\$ 949	VT-\$3,206	CA-\$440	27a

Total Education and General Revenues

The foregoing rankings of state appropriations and tuitions indicate the extent to which the states and particular types of institutions within the states rely on these sources for funding. The combined effect of this funding, along with support from endowments, gifts, and other sources, is reflected in total E&G revenues. These amounts, which exclude revenues from government grants and contracts, represent institutional resources available for support of general and primary operations, including functions such as instruction, academic support, student

services, and administration. On average, U. S. public institutions have \$4,907 per student for such operations. Alaska leads with \$12,940 per student in the public sector, followed by the District of Columbia with \$7,904, Vermont with \$6,668, Wyoming with \$6,219, and Utah with \$6,173. However, these all-inclusive summary measures for the public sector are less useful than specific values for each type of institution. By category of institution, the averages and range values for total E&G revenues per student in FY1982 were as follows:

Categories of Institutions	U.S. Averages	High State	Lew State	Ranking Table
Public, total	\$ 4,907	AK-\$12,940	MT-\$ 3,669	28a
Research univ., medical	\$ 8,586	NY-\$15,901	OK-\$ 5,202	28b
Research univ., nonmedical	\$ 6,837	CA-\$15,411	CO-\$ 4,881	28c

Other professional & specialized	\$ 5,644	TX-\$13,246	GA-\$ 2,667	28k

Government Grants and Contracts

Government, principally the federal government, is the major sponsor of research and other contracted activities at colleges and universities. Overall, these government revenues provided 13 percent of public institutional revenues (down from 15 percent in FY81). However at some types of public institutions, the share contributed by this source of funds was much higher, 19 to 20 percent. The level of funds provided through government grants and contracts for research and other

34

universities is shown in tables 29a-e, in dollars per faculty member. These schools conduct the bulk of research and hence receive the majority of government grants and contracts. The figures use the headcount of 9- and 10-month faculty. If large numbers of faculty are on 11- and 12-month contracts, the numbers shown will be overstated, since these faculty members are not counted and hence do not appear in the denominator. The averages and ranges for government grants and contracts per faculty member in FY1982 were as follows:

Categories of Institutions	U.S. Averages	High State	Low State	Ranking Table
Public, total	\$20,472	AK-\$ 62,191	MO-\$10,167	29a
Research univ., medical	\$ 58.969	NY-\$241,716	AL-\$13,513	29b
Research univ., nonmedical	\$39,474	GA-\$108,490	SC-\$11,154	29c
University, medical	\$26.989	NV-\$ 58,740	MO-\$ 9,266	29d
University, nonmedical	\$14,918	NH-\$ 32,684	IN-\$ 4.921	29e

Instruction Expenditures

The primary function at most public institutions is teaching and educating students. Hence, relative expenditures for instruction are an important measure of pedagogical emphasis among the states. National averages indicate that in 1982, public institutions spent an average of \$2,410 per student for direct instruction. The range of expenditures by type of institution was substantial, with health-professional institutions spending the most, \$19,673 per student, and two-year academic/comprehensive institutions spending the least, \$1,495 per student. Tables 30a-k show these variations, by state, for each category of institution

Research Expenditures

On average, public institutions spent \$16,192 per faculty member for research. However, public research universities (with medical programs) spent an average of \$67,149 per faculty member, with one state, New York, showing \$530,826 per faculty member (this number is probably an error caused by an undercounting of faculty). Nonmedical research universities spent \$50,075 per faculty member, while nonresearch universities spent on average \$16.853 and \$11.617 per faculty member, depending on whether their institutions did or did not have medical and related programs. Tables 31a-e provide these rankings.

Independent Institutional Finance

Tuition and fees are the primary source of funds for independent institutions. contributing 51 percent of revenues. Income from government grants and contracts was next in importance and provided 18 percent of funds, followed by gifts, providing 12 percent; endowments, providing 7 percent; state and local appropriations, providing 2 percent; and other diverse sources, providing 10 percent. (See rankings 44a-e for state variations in these patterns.) For independent institutions, tuition, gifts, and endowments are the key sources of funds that support general operations.

State and Local Appropriations

State and local appropriations are a very minor source of financial support for private institutions and usually are provided to assist specific numbers of state residents enrolled in particular programs such as medicine, veterinary medicine, and nursing. Only 28 states receive such support, and Texas led the nation at \$440 per student (see table 32).

Tuition Revenues

The average U.S. private institution collected \$4,271 per student in tuition and fees, but the range spanned from a high of \$6,018 in Vermont to a low of \$1,784 in Idaho. Table 33 shows the variations by state.

Total E&G Revenues

The key concern of all institutions is the total amount of operating funds. As indicated in the preceding tables, the average public institution functioned with \$4,907 per student. The average private institution had \$6,897 per student for operating support, an amount 41 percent greater than that of public institutions. However, these averages obscure differences in the numbers and types of institutions that exist in the public and independent sectors. For instance, in the public sector, two-year institutions and comprehensive institutions greatly outnumber other types of schools, and concomitant numbers of students are enrolled in them. For the independents, baccalaureate schools are more numerous and represent a substantial share of private sector enrollments. Universities are a key component of each sector. Importantly, independent institutions are substantially more graduate in their orientation (19 percent versus 9 percent at public institutions) as well as being smaller on average (1.343 students versus 4,533 students at public institutions). Both of these conditions imply higher expenses for the private sector. Tables 34a k provide rankings of the states for different categories of independent institutions in terms of total E&G revenues per student, excluding funds from government grants and contracts. Independent institutions showed the following averages and distributions in total E&G revenues per student in FY1982:

Categories of Institutions	U.S. Averages	High State	Low State	Renking Table	
independent, total	\$ 6,897	AK-\$12.860	AR-\$ 2,968	34a	
Research univ., medical	\$ 13.842	MD-\$24,686	FL-\$ 7,987	34b

2-year occupational	\$ 3.016	WI-\$ 6,380	AZ-\$ 1,252	341	
Health professional	\$31,653	TX-\$82,539	MO-\$13,15	2 34	
Other professional & specialized	\$ 5.558	VA-\$16,605	DE-\$ 2,482	34k	

Government Grants and Contracts

The typical private institution received \$35,193 per faculty member in government grants and contracts. The range of this support, however, varied tremendously by state, with private institutions in Maryland receiving \$102,037 per faculty member and those in Utah receiving \$3,311 per faculty member. There was also substantial variation among types of institutions. Research universities with medical programs received on average \$138,526 per faculty member; those without medical, \$123,183 per faculty member. Universities with medical programs received \$46,048 per faculty member; those without medical, \$19,076 per faculty member (see tables 35a-e).

Instruction Expenditures

Independent institutions, like public institutions, showed parallel variations in instructional expenditures by type of institution. On average, private

37

institutions spent \$3,018 per student on instruction. These expenditures varied from an average high of \$7,717 for research universities with medical programs to an average low of \$1,068 per student for two-year occupational institutions. Tables 36a-k show these distributions by type of institution.

Research Expenditures

On average, independent institutions spent \$21,277 per faculty member in research, ranging from \$62,110 in Maryland to \$6 in Montana. In most states, the independent institutions spent less than \$20,000 per faculty for research. (See tables 37a-e for state differences.)

Recent Trends

State and Local Appropriations

Percentage Change between 1981 and 1982. In absolute dollars, unadjusted for shifts in inflation and enrollment, states increased their support for public higher education in FY82 by an average of 8.5 percent. Actual circumstances, however, varied substantially from state to state. At one end of the spectrum, there are states such as Montana, Texas, Alaska, and Oklahoma, with funding boosts in excess of 20 percent. At the other extreme, Wyoming experienced a 21, 4 percent decline in public funding for higher education. Missouri, Washington, Idaho, South Carolina, and Alabama also experienced funding declines but not of that severity (tables 38a-1).

Percentage Change between 1980 and 1981. State funding increases in FY81 were stronger than in FY82. On average, states boosted their support of public higher education by 10 percent, with only two states showing a decrease of funding support, Michigan and Minnesota. Oil-producing states again showed the greatest improvements, led by Wyoming

with a 35. 9 percent surge in appropriations for public higher education. Following were Louisiana, with a 24.9 percent increase, North Dakota (19. 8 percent), and Oklahoma (19. 0 percent) (tables 39a-1).

Percentage Change between 1978 and 1982. Between FY78 and FY82, average state and local appropriations increased 44, 2 percent for public institutions and 38. 0 percent for independent institutions. During this period, appropriations for public institutions increased in all states, ranging from an 86. 4 percent increase in Oklahoma to a 15.0 percent gain in Wyoming. Increases in state and local appropriations by type of institution were as follows:

Categories of Institutions	Percent Change in State & !.ecal Apprepriations 1978-1932	Ranking Table

38

Encollments

Percentage Change between 1981 and 1982. Across the U.S., enrollments at public institutions gained an average of 2.3 percent between FY81 and FY82. Alaska led the nation with a 16.1 percent increase in students, followed by Louisiana and Mississippi (with gains of 6.5 percent) and Virginia (6.4 percent). Enrollments decreased in nine states, with Nevada showing the greatest loss (4.4 percent). Increases were strongest in the two-year sectors as well as the other professional and specialized institutions. Enrollments decreased only in the health-professional sector, dropping 1.4 percent.

In the independent sector, the gains in enrollment were slightly larger, enrollment growing by 2. 6 percent. Alaska ranked 1st with an increase of 23. 7 percent, which even outstripped growth in the public sector in that state. Eleven states saw enrollments shrink in the independent sector (tables 41a-1).

Percentage Change between 1980 and 1981. Enrollment in the public sector between FY80 and FY81 increased by 3.2 percent. Nevada and Alaska both had increases in excess of 10 percent, but in most states the gains were between 2 and 5 percent. Five states had enrollment losses; in Washington enrollment fell by of 8.9 percent, and in the District of Columbia it fell by 7.0 percent. In the private sector, enrollment expanded by 4.1 percent (tables 42a-1).

Percentage Change between 1978 and 1982. Public enrollments from FY78 to FY82 increased by 5. 6 percent on average. The largest rates of growth were in Nevada, at 16. 5 percent; Iowa, at 15. 0 percent; Virginia, at 14. 5 percent; South Dakota, at 12. 9 percent; and Indiana, at 12. 2 percent. Three states experienced declines in public FTE enrollment: the District of Columbia (11. 0 percent), Hawaii 8

(. 9 percent), and Connecticut (. 7 percent). Enrollment gains in the public sector were greatest in the two-year occupational schools (13.3 percent) and the health-professional institutions (8. 1 percent). The other professional and specialized institutions were the only category of public institutions with losses, enrollments dropping by 8. 2 percent. Enrollments at independent institutions increased during this period at a faster rate than enrollments at public institutions, 10, 6 percent versus 5, 6 percent. Only nine states didn't share in these gains. Enrollment decreased in the private sector in New Mexico and Hawaii by 13.4 percent, in Alaska by 6. 7 percent, in South Dakota by 6. 0 percent, in Utah by 5. 4 percent, in Delaware by 3. 0 percent, in Alabama by 1. 4 percent, in Vermont by 1. 3 percent, and in Idaho by 1. 0 percent. Again, changes in enrollment varied by type of institution:

Categories of institutions	Percent Change in Enrollments 1978-1962	Ranking Table

Constant-Dollar Revenues per Student: Appropriations

Percentage Change between 1981 and 1982. State appropriations diminished by 3. 6 percent in FY82 in comparison to the prior year, when inflation and a 2.3 percent increase in enrollments are taken into account. The majority of states experienced some loss in this regard: 14 with losses of 5 percent or less, 13 with losses between 5 and 10 percent, and 7 with losses greater than 10 percent. Clearly, FY82 was a year of significant retrenchment in state funding for public higher education. Wyoming had the greatest decline, as the purchasing power of state funding fell by approximately one-third. These state-by-state rankings are shown in tables 442 and b.

Percentage Change between 1980 and 1981. FY81 was similar to FY82 in the degree of retrenchment in state funding, with state funds shrinking by 3. 7 percent. More states were impacted than in FY82, though, as 37 states faced some degree of funding loss. Eleven states had losses greater than 10 percent (tables 47a and b).

Percentage Change between 1978 and 1982. Overall, between 1978 and 1982, public institutions experienced a 5.3 percent loss in the real-dollar value of their appropriations, after adjustment for inflation and enrollment gains. For two-thirds of the states this was a belt-tightening period, and purchasing power declines ranged from 26. 6 percent in Wyoming to less than 1 percent in North Carolina. Eight states had losses greater than 15 percent: Wyoming (26.6), New Hampshire (24. 1), Idaho (21. 8), Michigan (20, 0), Missouri (16, 9), Ohio (16, 3), Pennsylvania (15.6), and Rhode Island (15.4). Three states had losses between 10 and 15 percent, including South Dakota (14. 7), Iowa (14. 1), Massachusetts (13. 8), Minnesota (13.7), Washington (13.0), Wisconsin and Vermont (12.9), Alabama

40 BEST COPY

(12. 6), California (12. 2), Indiana (11. 7), Nevada (10. 8), and Connecticut (10. 1). Six more states had losses between 5 and 10 percent. States in this category included New Jersey (9. 0), Illinois and Arkansas (8. 9), Oregon (8. 6), Nebraska (8. 5), and Montana (7. 6). Twenty-six states had losses exceeding 5 percent.

Among the states that did well in this period were Oklahoma, with constant-dollar gains per student of 28.8 percent, Texas with 16.3 percent, North Dakota with 15.2 percent, West Virginia with 13.9 percent, Louisiana with 13.6 percent, and Alaska with 13.0 percent.

State funding to the independent sector declined by 13.5 percent during this period in constant dollars, with decreases in 20 states. Substantial decreases were evident in Idaho, Maine, California, Iowa, Tennessee, Minnesota, North Carolina, Indiana, Connecticut, Ohio, Oregon, and Pennsylvania. Other states had significant though lesser losses (see tables 50a and b).

Constant Dollars per Student: Tuition and Fees

Percentage Change between 1981 and 1982. Tuition increases in FY82 were sufficient to cover both inflation and enrollment growth, netting a 1.9 percent improvement in tuition revenues per student. All sectors except the health-professional sector produced some real-dollar growth in revenues from tuition. Most states participated in these improvements, with public institutions in 34 states and independent institutions in 35 states showing some net gain. Seventeen states, however, experienced net losses in the public sector in funds from tuition, Oklahoma losing 10. 8 percent of the purchasing power of tuition revenues. The District of Columbia had the greatest gains, totaling nearly 50 percent. Nevada was next with a gain of 21.1 percent (tables 45a and b).

Percentage Change between 1980 and 1981. Small net gains in tuition funds occurred in the public sector in FY81, amounting to . 3 percent. However, only 22 states showed any improvement in funding from tuition. Twenty-eight states, by contrast, found the value of their tuition revenues diminished. The overall pattern for the independent sector was similar (a gain of . 6 percent), but many more states (32) had some gains (tables 48a and b).

Percentage Change between 1978 and 1982. Between 1978 and 1982, the real value of tuition and fees per student increased by 1. 4 percent in the public sector and by 2. 8 percent in the independent sector. Given the heavy reliance of independent institutions on tuition, these gains were particularly important. As indicated in table 51b, the independent sector made real-dollar gains in tuition in 37 states and experienced declines in 12 states. For public institutions, real-dollar losses in tuition were much more prevalent. Only 26 states obtained cuition improvements, led by West Virginia, which had real-dollar gains per student of 65. 8 percent. By contract, Hawaii had a loss of 20. 8 percent. These figures are shown in full in tables 51a and b.

Constant Dollars per Student: E&G Revenues

Percentage Change between 1981 and 1982. FY82 was a year of general retrenchment in funding support in the public sector (excluding government grants and contracts), once revenues were adjusted for inflation and enrollment shifts. On average, public higher education saw its revenue base eroded by 2. 0 percent. Two-thirds of the states were affected by these losses, and in 23 states the losses exceeded the average, with decreases ranging as high as 24. 1 percent in Wyoming. In the independent sector the

profile was more encouraging. On average, there was a small but real gain of . 7 percent in total funding, after adjustment for inflation and enrollment. Thirty-one, or nearly two-thirds, of the states had some net gain. Still, in 18 states the independent sector had to operate with fewer funds (in constant-dollar terms) than the year before (tables 46a and b).

Percentage Change between 1980 and 1981. FY81 was also a year of general retrenchment in total funding support for the public sector, even more so than in FY 82. Net revenues decreased by 2.9 percent in FY81, and in three-quarters of the states the public sector had to function with less funding than a year earlier. Losses in purchasing power per student ranged from less than 1 percent in eight states to 15.7 percent in Nevada. Again in the independent sector, there were small gains (. 4 percent). Still, in 20 states the independent sector was not able to keep pace with inflation and enrollment shifts (tables 49a and b).

Percentage Change between 1978 and 1982. Between 1978 a d 1982, the net effect of revenue changes for higher educatio was an overall decline in the funds available in the public sector (average of 2, 3 percent) and a 3, 7 percent improvement in the independent sector, even after adjustments for enrollment changes and inflation. Public-sector losses were tied to reductions in state appropriations, and the small real-dollar increase in tuition was not able to fully compensate. Gains in the independent sector were largely tuition based. Gains in total funds in the public sector were evident in only 20 states, and in the independent sector they were evident in 38 states. Losses in one or both sectors were experienced in more than 30 states. Wyomffig in particular suffered a serious loss in its public-sector purchasing power. which fell 20. 0 percent per student.

ERIC Full Text Provided by ERIC

9

Other states whose public sectors faced hard times due to losses included: Montana, 14. 4 percent; Michigan, 12. 1 percent; Iowa, 11. 3 percent; Wisconsin, 10. 1 percent; South Dakota, 9. 7 percent; New Hampshire, 9. 7 percent; Missouri, 8. 6 percent; Rhode Island, 7. 8 percent; Idaho, 7. 6 percent; Illinois, 7. 3 percent; and Indiana, 7. 2 percent (tables 52a and 52b).

Importance of Different Revenue Sources

In 1982, there were major differences between the states and between the public and private sectors in the means of financing higher education. For public institutions, state and local appropriations provided the lion's share of funds, representing 58.8 percent of all revenues. Tuition was next in importance, accounting for 16.8 percent of revenues, followed by government grants and contracts at 13.3 percent. In FY82, tuition increased its share of total support (from 15.9 to 16.8 percent) while government grants and contracts became a less important contributor (dropping from 14.8 to 13.3 percent). These three sources furnished nearly 90 percent of the E&G funds allorated to public higher education. For the independent sector, tuition carried the major load, 51. 1 percent; government grants and contracts contributed 17.5 percent; gifts, 12. 3 percent; and endowment income, 7.4 percent. And as was the case in the public sector, tuition became a more important source of revenues while government grants and contracts became less important.

There were major variations among the states in their reliance on these sources. For example, the public sector in the District of Columbia received 77. 3 percent of its funds from local sources (in its case, federal), followed by Oklahoma, 69. 7 percent; Hawaii, 67. 7 percent; Alaska, 67. 1 percent; California, 66. 7 percent; and Louisiana, 66. 1 percent. These states/localities assumed an unusually large role in the financing of public higher 10

education. At the other end of the spectrum were states like Vermont, whose state and local sources provided only 22. 3 percent; New Hampshire, 32. 8 percent; Delaware, 41. 0 percent; Colorado, 41. 6 percent; Delaware, 41. 0 percent; and Pennsylvania, 44. 9 percent (table 53a). These states carried far smaller shares than the nearly 60 percent load that was typical of the other states. To compensate to some degree, each of these states collected large shares of their revenues from tuition (generally more than 20 percent) and ranked among the top 10 in the country in their reliance on tuition as a source of funds.

Independent institutions showed an even greater degree of variability in reliance on tuition, ranging from a high in Vermont of 76.9 percent to a low in Alaska of 22.0 percent (table 54b).

Tables 53a-e provide rankings of the states for public institutional reliance on various funding sources. Comparable data for private institutions appear in tables 54a-f.

Faculty Salaries

At every rank, faculty at public institutions in Alaska were the best paid, and Alaska had the highest overall average salary in 1982. However, the well-known , high cost of living for Alaskans was not factored into these salary levels. Alaska was followed by California, Arizona, New York, and New Jersey. Faculty at public institutions in South Carolina showed the greatest rates of increase in salaries between 1978 and 1982, gaining 52 percent. Faculty in public institutions in Georgia were next, with salary gains of 48 percent for the period. Other states that showed major gains included Oklahoma with 47 percent, Arizona with 44 percent, and Louisiana and North Dakota with 43 percent. At the other end of the spectrum, faculty in Hawaii's public sector gained only 24 percent; the District of Columbia,

25 percent; Tennessee and Oregon, 27 percent; and New Hampshire, 29 percent. Tables 55a-e provide public-sector rankings by state for average salaries and percentage changes in salaries.

In the independent sector, California faculty led the nation in average salary for all ranks (17 percent above average). Between 1978 and 1982, private faculty salaries improved by 44 percent in California, by 42 percent in Rhode Island, by 41 percent in Texas, and by 40 percent in Vermont and New Hampshire. Tables 56a-e provide these figures for independent institutions by state.

The remainder of this chapter presents state rankings for the key measures used in this study (a listing of the tables begins on page vii).

# CHAPTER 2: METHODOLOGY

State and local governments are by far the largest financial supporters of higher education in the United States. Efforts to evaluate state appropriations and to identify potential changes in the states are therefore critical to successful financing in the public sector, and are also of great interest to the private sector. This report, focusing on comparisons among the states, is intended to aid in this process. Two general guidelines have been followed:

- The broadest possible approach has been taken, in order to point up the substantial differences among states in the conditions that affect financing. Thus the study includes information about the different economic conditions in the states, the extent to which other public services compete with higher education, the relative importance of private higher education, the student enrollment load, and other fundamental conditions that affect higher education financing in the state. An understanding of these basic differences is essential to the informed development of policies for financing.
- Much detail has been provided on the specifics of institutional financing, to establish data comparability as well as important benchmarks and guides so that meaningful comparisons can be made.

Thus the study presents both a macro view of financing at the state-budget level and micro detail about institutional revenues and expenditures. Each state profile provides diverse data for the reader, ranging from the state tax base to a breakdown of expenditures by particular institutional function. Much of the data is interrelated to show the consequences of

increases or decreases in one or more of the elements. Thus it is possible to determine, for example, that low state appropriations per student may result from a low tax base, a low tax effort, competing public services, a low allocation rate, a high student load, heavy reliance on tuition, an education system that emphasizes more expensive forms of higher education, or any combination of these factors. To fully understand state support levels, information on all of these factors is necessary.

#### **NEED AND RESPONSE**

Two recent developments made it easier and increased the incentive to produce this study. First, the collection of financial data by the National Center for Education Statistics (NCES) has vastly improved since NCES first produced the Higher Education General Information Survey (HEGIS) in 1966. The HEGIS data base is consistent, detailed, comprehensive, and essentially responsive to national statistical requirements. NCES is continuing to work on the data-collection system and on definitions, in order to overcome long-standing problems in data comparability.

Second, since the data have improved, the higher education community would like to see the statistics effectively communicated. Legislators and college officials are well aware of the potential use for published data that can clearly document financial needs and provide sound justification for funding requests. Their need for such data is multiplied now that austerity in government spending and increased competition for funding among public services demand rigorous budget presentations.

This study has also been prompted by the need for an analysis of financing that goes beyond a few simple aggregate measures. Such measures, although commonly used, are entirely inadequate and often misleading. As one example of how state rankings for a single measure can be misinterpreted, consider appropriations per capita. Of the states that rank lowest in the United States for this measure, only one has a substantially underfinanced education system (compared to the norm). The others have nearly average total operating funding per student, either because state support is supplemented by high tuitions or income from other sources, or because there are fewer students to educate.

This study gathers and organizes a comprehensive set of state-level financial and supporting statistics on higher education. However, regardless of how detailed and thorough any study of financing is, all conditions affecting higher education cannot be accounted for, and many cannot be measured. Therefore, the data must be interpreted with the understanding that unique circumstances within the states can lead to a wide range of acceptable practices. For example, the level of appropriations is not so much a consequence of legislative action as it is of evolving conditions determined by many factors: educational-opportunity objectives, student financial-aid programs. the role of private institutions, government wealth, preparation of high school graduates to attend college, and geographical access. No financial study can possibly replicate this complexity or substitute for local knowledge, interpretation, and judgment.

Comparisons between states are inevitable. This study assumes that such comparisons, when made with some understanding of

ERIC*

underlying factors, are of value in establishing perspective, identifying alternative financial policies and practices, and helping to set realistic support goals.

#### STUDY DESIGN AND ORGANIZATION

In conducting the study, the first step was to develop an approach to higher education financing that included as many as possible of the relevant components of the basic conditions in a state and in its higher education system. This resulted in the inclusion of data on enrollment, state and local government fiscal analyses, institutional structuring within the public and private sectors, conditions related to and affecting financing, and institutional revenues and expenditures.

The data for each state have been organized by topic, with each topic presented on a separate page. While these divisions serve to focus attention, the topics are interrelated and should be studied jointly.

A variety of measures have been used, each type serving a different purpose: (1) absolute amounts, which permit verification of the base data; (2) relative terms (based on user or load units), which establish comparability; (3) percent distribution, which identifies relative contribution; (4) constant dollars, which illustrate trends in purchasing power; and (5) indexes with respect to the U.S. average (printed in bold print) and state ranking, which establish relative positions.

The principal means of analysis is interstate comparisons. Every effort has been made to allow for fair and meaningful comparisons. However, limitations in the data collected, the variability of accepted practice, and the distinctive nature of each institution make state comparisons more general guides to relative behavior than exact measurements. In every instance, these statistics should be supplemented 78

when possible with local information and judgment.

The study is designed for use in the following types of analyses:

- Review of higher education's share of the state and local budget, higher education being one of many competing public services
- Evaluation of the role of state tax capacity, tax effort, and allocation rates in establishing appropriations to support higher education
- Study of tax capacity and tax effort for each type of tax as a means of assessing tax policy
- Review of the distribution of state appropriations to institutions and to students
- Study of FTE enrollment in comparison with national averages
- Identification of a state's student-enrollment pattern by type of institution within the public and independent sectors
- Evaluation of state and local appropriations and other revenues on a per-student or other-user basis by type of institution
- Evaluation of various institutional expenditures on a per-student or other-user basis by type of institution
- Review of trends in state and local government appropriations by type of institution relative to requirements imposed by enrollment growth and inflation
- Study of trends in tuition revenues as a percentage of instructional expenditures by type of institution

- Study of the effects of inflation on state and local appropriations, tuition and fees, and total educational and general revenues, and the associated gain or loss in purchasing power
- Study of trends in the mix of support for higher education by revenue source
- Study of the level and trends in faculty salaries by rank and by type of institution

The focus of this report is the states. Chapter 1 provided a summary of national trends and state patterns and provided state rankings on state and local government finances, population and enrollment, institutional financing for public and private institutions, trend data, and faculty salaries. This chapter describes the methodology used in this study and in the state by state reports in chapter 3. Chapter 3, which is the focal point of this study, presents individual state reports for all 50 states and the District of Columbia, as well as the U.S. average.

Appendix A includes a listing of all institutions by state, grouped by institutional category, and explains the classification system used in this report. Appendix B presents documentation on the sources of data used in this report, and cautions on data use.

### **EXPLANATION OF THE STATE-REPORT ANALYSIS**

Each state report presented in chapter 3 consists of eight pages and is divided into eight topics: Commentary; State Financing of Higher Education; Public Institutions: Status Report; Independent Institutions: Status Report; Trends; Inflation-Adjusted Trends; Faculty Salaries; and Institutional Descriptors and Data Notes.

#### Commentary

A commentary introduces each state report. Each commentary follows a basic format, but special attention is given to unique state conditions and accomplishments. Each state commentary describes recent trends, state financing of higher education, state tax base and budget, higher education enrollments, and institutional finance and characteristics. Some questions to which the commentary responds are:

- Have state and local government appropriations kept pace with enrollments and inflation, in order to preserve the purchasing power of institutions?
- What are the significant trends in appropriations and tuition for each type of institution?
- Is the state's provision of student aid and support to individual institutions appromiate, given the proportion of residents attending public and private institutions?
- How wealthy or poor is the state in terms of its ability to support public programs through taxation, and to what extent has this tax potential been tapped?
- How important is higher education in the state budget when compared to other public services?
- Is the state's allocation of tax revenues to higher education consistent with enrollment levels and tuition policy?
- Are public enrollment levels consistent with state goals for higher education? Are college entrance rates, in-migration, student retention,

- and the proportion of full- and part-time students at desired levels?
- What is the structure of public and private higher education in the state? Which types of institutions enroll the most students, and how do enrollment patterns affect financial requirements?
- To what extent do residents attend colleges elsewhere?
- How do expenditures per student cor pare with national averages for each type of institution? In particular, how do the institutions with the largest enrollments fare in this measure of financial strength?
- How do appropriations and tuition contribute to the adequacy or in dequacy of institutional revenues?
- To what extent do sources other than state government and students contribute to institutional support?
   Do any types of institutions a pear excessively dependent on a single source of income?
- How has the mix or revenues by source changed over time, and what are the implications for future financing if the trend continues?
- How does the emphasis on graduate education or the size of institutions affect the financial requirements of institutions?
- What is the overall position of faculty salaries in the state? Where are the strengths and weaknesses? Is the situation improving or worsening?

#### State Financing of Higher Education

The first data page of each state report includes background information on the

state to provide a context for assessing state and local government support of higher education. Included on this page is a profile of the state's population and enrollment, its tax structure, the amount allocated to higher education, and finally, the distribution of state and local appropriations within the higher education system and among the various other functions of government.

State and Local Government Support of Higher Education, Although government funding decisions are developed in a context of historical precedents and current political and citizen pressures, they nevertheless ultimately depend on the state's wealth and how it is secured and used in terms of tax rates and allocation percentages. The figures in the arrow on this page give a picture of this reality. Beginning at the left, tax capacity (the amount of revenue the state and local government would raise if a national uniform set of 'ax rates were applied) is multiplied by tax effort (the extent to which a state taxes its available resources) to equal state and local government tax revenues collected. These tax revenues are then multiplied by the percentage of taxes allocated to higher education (for general institutional support, student aid, and "other" support) to equal the dollar amount appropriated to higher education by state and local governments. Tax capacity is fixed by the state's economy and is relatively stable; both tax effort and the allocation rate can be changed by legislative action. The index numbers (the U.S. average=100) indicate how the state compares to the national average.

The table above the arrow presents dollars per capita and percent distribution by function—student aid, general institutional support, and "other"—and by sector. The "other" category includes higher education appropriations that are neither for student aid nor for direct institutional support—payments for central state

ERIC

Full Text Provided by ERIC

services for libraries and computing, central administrative expenses, state boards and commissions, fringe benefits and retirement payments to postsecondary personnel, support for postsecondary vocational education not encompassed in the HEGIS reporting universe, and payments to other states for education services. Dollar values in this table are likely to be less informative than the mix of support and the percent distribution. If the index values are used, a state's higher education budget profile can be compared with national averages, and any exceptional deviation can be reviewed for consistency with state policy.

State and Local Governments Direct General Expenditures by Function. The pie chart and the associated table indicate the percentage distribution of the state and local government budget ¹ for seven categories of public services (higher education, elementary/secondary education, highways, public welfare, health and hospitals, public services, and "other"). The table also provides the same information for 1978, as well as the total dollars per capita. Index numbers (U.S. average=100) are in bold print.

The financial support given any public service depends on many factors: public den. d, unit costs, government capacity to finance, and competing claims. Certain universal needs, such as elementary and

secondary education and health care, typically are given a high priority by states and communities, and their per capita funding varies less than other public services such as welfare and higher education.

State support of colleges and universities depends a great deal on a state's philosophy about what constitutes adequate provision of "educational opportunity," who should pay (based on the interpretation of who benefits), and what the standards for geographical and program access should be. State history, citizen expectations and attitudes, urbanization, climate, and cducational opportunities in nearby states are some factors that influence decisions in these areas. A few states have decided not to be in the higher education "business" as much as others. They intentionally plan to be "debtor" states and encourage residents through extensive student aid programs to attend out-of-state schools.

Tax Capacity and Effort. The chart at the lower right of the page presents data on tax capacity and tax effort for ten tax categories. Collected revenues and overutilized or underutilized potential are reported for each tax category, together with related rankings and national averages. The relative importance of the various tax bases as potential revenue sources is indicated by the percent distribution of c.pacity.

 State and local tax capacity measures the potential of state and local governments to obtain revenues for public purposes through various kinds of taxes. Earnings of local residents are only one source of tax revenues; therefore, this tax capacity measurement is not equivalent to per capita personal income. Tax capacity is measured here by the "representative tax system," 2 which defines the tax capacity of a state and its local governments as the amount of revenue they would raise if a national, uniform set of tax rates were applied. The sum of the capacities for all states equals the total tax revenues collected in the United States. The tax bases represent, for each of the various kinds of state and local taxes, the degree to which taxable activity exists within the jurisdiction. The tax rates applied are based on the average amount of taxes collected nationwide expressed as percentages of the total U.S. tax-base activities. For example, if 5 percent of total general sales is collected in taxes nationally, then 5 percent is the rate applied to the level of general sales in each state. Thus, the tax (or capacity) in a state is the level of economic activity being taxed, multiplied by a common tax rate.

80

ERIC Full Text Provided by ERIC

The state and local government total budget per capita (pie diagram) is substantially larger than the amount of taxes collected per capita (lower-right table) because the budget includes nontax revenues and exceptional types of tax revenues not reported as part of the "representative tax system," and because the budget has a different reporting date (1982 versus 1981). The state budget for higher education per capita is larger than total appropriations for higher education (upper-left table) because the budget includes (and appropriations exclude) funding of auxiliary enterprises, capital investment, federal revenue-sharing funds, independent operations, and revenue for centrally unded offices, faculty fringe benefits, and student aid when they are

not part of an institutional account.

The "representative tax system" approach to capacity measurement was initially developed by the Advisory Commission on Intergovernmental Relations (Mushkin and Rivlin) and simplified for yearly computation by Robert Reischauer and later by Kent Halstead. See Halstead, Tax Wealth in Fifty States, U.S. Government Printing Office, Washington, D.C., 1978, 255 pp., stock no. #017-080-01871-3. The most recent update of this work is 1981 Tax Capacity of the Fifty States, Advisory Commission on Intergovernmental Relations, Washington, D.C., September 1983.

Ten tax categories are included in this report. They are: general sales, selective sales and gross receipts, licenses, individual income, corporate net income, three categories of property tax (residertial, commercial and industrial, and farm), death and gift taxes, and severance.

- Tax effort measures, in percentage terms, the extent to which states tax their available resources. The total tax capacity nationwide is equal to the tax revenues collected by all states. Since the nationwide effort by definition is 100 percent, the index of tax effort for individual states indicates how each state compares with the national average.
- * Education financiers and elected officials charged with providing government services and establishing taxation policies have a responsibility to understand tax capacity and tax effort. When the adequacy of higher education or any government support service is challenged, questions will arise, such as, How does our state compare with its neighbors in its ability to raise money through taxes? Do we realize as much revenue from our tax sources as states with similar capacity and economic structure? These initial inquiries generally lead to consideration of changes in specific tax rates or to decisions to encourage growth in certain tax bases. The chart of tax capacity and effort presents data for answering these questions.

Enrollments. The brief enrollment summary in the lower left-hand corner of the page lists the population of the state and its ranking relative to other states, the FTE enrollment in higher education and its state rank, and the enrollment distribution between the public and private sectors. The section called "Enrollment of State Residents (per 1,000 population)" provides an FTE measure of resident-student access to higher education at the state's public or independent institutions and at out-of-state institutions. The total enrollment of state residents (FTE) indicates the extent of access for residents to higher education both in and out of state. Each measure (except population and enrollment) is indexed to the U.S. average.

#### Public Institutions: Status Report; Independent Institutions: Status Report

The format of the "Status Reports" for the public and independent sectors (which are found on the second and third data pages of each state report) are basically the same. Only the methods used to derive enrollments (presented in the arrows) and the categories of revenues differ. (For the independent sector, private gifts and endowment income are shown separately; for the public sector these revenue categories are combined.) Each report contains five parts: the principal entries for "Institutional Revenues" and "Institutional Expenditures" and the supporting entries for "State and Local Finances Per Capita," "Enro 'ments," and a profile of institutional support and enrollments by institutional category.

In the broadest terms, proceeding from top to bottom, the status reports show how state and local government appropriations, allocated by type of institution, interact with related enrollments per capita and result in appropriations per student, which, together with other institutional revenues, support institutional expenditures.

State and Local Finances. The end result of the upper part of the arrow on these

pages shows appropriations per capita for the public and independent sectors. This amount is derived using the following computation: state and local tax revenues are multiplied by the percentage of taxes allocated to higher education, to equal the dollar amount appropriated to higher education. (The computation to this point is the same as described in the arrow on the first data page.) This allocation in the "State and Local Government Support of Higher Education" table is then multiplied by the proportion of the revenues allocated to public/independent institutions, to equal the state and local appropriations per capita to the institutions. Each variable is indexed to the U.S. average.

To analyze the adequacy of this financial support, the reader must assess the data on institutional revenues and expenditures located in the tables at the bottom of these data pages. For example, deficiencies noted in per-student appropriations may be traced back to a below-average allocation of state and local government tax revenues.

Public/Independent Enrollments. Enrollments are a primary measure of the work load carried by colleges and universities. For the bottom part of the arrow, different calculations are used for the public and independent sectors to determine the FTE enrollment. For both sectors, all enrollment measures are reported in terms of the state's population (per 1,000 residents). In the public sector, the following variables are used to calculate the FTE enrollment:

 High school graduates is the number of high school graduates in the state from the previous spring (approximately 93 percent of the average fall freshman class are recent high school graduates). 3 Graduates from public and private high schools are included.

- Entrance rate is a ratio of the first-time resident enrollment in public institutions as a percentage of high school graduates. This rate reflects how well public institutions compare to private and out-of-state schools in attractiveness of educational programs, tuition level, and location. It also suggests how well high school graduates are prepared for college, and the disposition of students, parents, and the community toward attendance at state institutions. The entrance rate is usually the most important factor in determining a state's final FTE enrollment level, and the condi ions contributing to high or low rates should be studied.
- First-time resident enrollment is a headcount of resident students enrolled for the first time at public institutions of higher education.
- In-migration is a headcount of nonresidents enrolling for the first time in public institutions in the state per 1,000 population. Factors influencing in-migration include low nonresident tuition, academic reputation, program offerings, state topography and climate, and competitive effort to encourage nonresident attendance.
- First-time enrollment is the sum of resident and nonresident students enrolling for the first time.
- Retention factor is the ratio of first-time headcount enrollment to total headcount enrollment in public

institutions and reflects the proportion of students who continue their education beyond first-time enrollment. State systems that emphasize upper division, graduate, and professional education generally have high retention factors; those that focus on two-year terminal programs typically show lower retention rates. Selective admissions and successful continuing-education programs also affect retention.

- Conversion factor in public institutions is the ratio of total headcount to FTE enrollment, that is, the degree of full-time as opposed to part-time enrollment. High ratios suggest conditions and programs that encourage or require full-time enrollments, while low ratios may be due to numerous graduate and continuing-education programs, where part-time attendance is common.
- FTE enrollment per 1,000 population is the aggregate load measure used in this analysis at the state level.

The calculation of FTE enrollment (per 1,000 population) in the public sector is as follows: the number of high school graduates is multiplied by their entrance rate to public institutions to make the number of first-time resident enrollments. Adding this number to the number of first-time out-of-state students yields the figure for total first-time enrollments. Total first-time enrollments are then multiplied by the retention factor (to obtain total enrollment) and the conversion factor to convert headcount to FTE enrollment, which results in total FTE enrollment in public institutions.

Public enrollments reflect a number of conditions: the degree to which the state's high schools prepare pupils for college entrance, the opportunities within the state for postsecondary enrollment, the attractiveness of the state's institutions to nonresidents, and year—to—year retention rates. Improving these conditions is a typical educational goal of states. Therefore, state planners generally consider the size of public enrollments and how they were calculated when analyzing financial support requirements. Many state budgets, in fact, are based in part on enrollment—driven formulas.

The calculation of FTE enrollments (per 1,000 population) in the independent sector uses only two variables -- resident enrollments and out-of-state enrollments. This is because independent institutions typically draw a more universal clientele than public institutions, often enrolling more out-of-state and foreign students than state residents. They receive little state support and generally feel less responsibility for educating residents than do public institutions. The formula used to determine FTE enrollment in independent institutions is: resident enrollments plus out-of-state enrollments equals total FTE enrollment.

Institutional Categories and Enrollment Profile. To the right of each arrow on data pages 2 and 3, institutional support per capita and FTE enrollments per 1,000 population are shown (with their index values) by institutional category. The percentage share of total enrollments for any one of the 10 institutional categories can be computed by dividing a category's FTE enrollment by the total FTE enrollment for the sector.

The institutional categories reported are, in the judgment of the authors, the minimum

³Alexander W. Astin, Kenneth C. Green, William S. Korn, and Mary Jane Maier, The American Freshman: National Norms for Fall 1983 (Los Angeles, Calif.: American Council on Education and the University of California, 1983).

number required to establish reasonable comparability at the state level and are used throughout the document. They are: research universities, which grant doctorates and are among the top 75 institutions in the country ranked on budget research expenditures (there are two institutions that are exceptions but are included in the research university category because of their graduate and research emphasis: Rockefeller University and Georgia Institute of Technology: thus 77 institutions are used in this study); universities, which grant substantial numbers of doctorates but are not as significantly involved in research activities as the research universities (both types of universities are then subclassified as either with or without medical, indicating the presence of medical, dental, osteopathic, or veterinary medicine programs); comprehensive institutions, which grant graduate degrees, primarily at the master's level; general baccalaureate institutions, which award most degrees at the bachelor's level; two-year academic and comprehensive colleges, which emphasize associate and certificate degrees: two-year occupational colleges, which grant associate and certificate degrees primarily in occupational fields; health professional colleges, which grant degrees in a variety of medical areas including first-professional degrees; other professional and specialized institutions, which include professional health programs that do not confer first-professional medical degrees. engineering schools, teachers colleges, law schools, rabbinical schools, and seminaries. The categories are defined in detail in appendix A.

The characteristics that distinguish the various types of institutions have an important influence or financing. Each institutional category has a relatively distinct mission, instructional program, and student level. Each institutional category thus differs in faculty requirements, faculty salary rates and work loads, class

size, necessary supporting equipment, student personnel services, administrative overhead, plant size, and other operating conditions that affect costs. In states where large proportions of students attend universities, with their inherently costly complex of programs and degree levels. support requirements are high. In states where enrollment emphasis is on two-year colleges, which are far less expensive to operate, support requirements for the total public system will be substantially less. Because differences in enrollment patterns among different institutional categories greatly affect total funding requirements, it is important that states understand how their structures differ from those of other states and how these structures affect funding. This knowledge will encourage development of an overall plan for financing based on an independent determination of support needs for each type of institution within the system.

Institutional Revenues and Expenditures. The tables at the bottom of data pages 2 and 3 are divided into two parts—institutional revenues and institutional expenditures. Since institutional revenues and expenditures per user unit (principally students) represent the financial bottom line, this analysis is presented by institutional type.

The indexes for revenues and expenditures are computed using U.S. averages for each of the institutional categories. Thus, the revenues and expenditures for a given type of institution in one state can be compared with values for the same type of institution in other states and with the national average. Since enrollment is the basic load for instructional and related supporting activities, most revenues and expenditures are reported on a per-student basis. Government contracts and grants (mostly sponsored research) are reported per faculty member; public service expenditures are reported per 1,000 population. The lower part of the tables presents'a percent

distribution of revenues and expenditures, including indexes relative to the U.S. average.

Institutional Revenues. The revenues presented are for current operations relating to the institution's educational mission and immediate supporting activities. These educational and general (E&G) revenues exclude income from sales and service of auxiliary enterprises, hospitals, independent operations, and revenues for physical plant construction.

The following are brief definitions of each revenue category; more detailed information can be found in appendix B.

- State and local government appropriations include the amounts provided to institutions by state and local government legislative bodies for current operations, excluding grants and contracts.
- Tuition Revenues report the revenues obtained from tuition and fee charges assessed students for current operating purposes, including those amounts remitted to the state to offset its appropriation. When a large proportion of out-of-state students is enrolled, nonresident tuition payments increase the average tuition per student to an amount substantially above the resident rate.
- Private gifts, grants, and endowment income include revenues from donors for which no legal consideration is involved, and income received from endowment and similar funds (and expended for current operating purposes).
- Other E&G (excluding government contracts) includes: federal government appropriations (mostly to land-grant institutions); revenue from sales and services of educational

188

activities, such as film rentals, scientific and literary publications, testing services, university presses, and dairy products; and revenues from sources not covered elsewhere.

- Total E&G (excluding government contracts) is an intermediate revenues total that provides a measure of general operating funds excluding government grants and contracts (that is, research and training funds). This is a key measure to compare in assessing the adequacy of operating funds for each institutional category. Consideration should be given, however, to the relative extent of graduate education provided and average institutional size, since these conditions affect funding needs and are not accounted for here.
- Government grants and contracts are revenues (both direct and indirect) from government agencies for specific research projects and training programs.
- Total E&G revenues are the total of all E&G revenues, including sponsored research. This total cannot be related to a single user unit and is therefore reported only in absolute dollar amounts.

For any given institutional category, the dollar amounts for each type of revenue should be checked against national averages and levels in other states. A large contribution from a single source may compensate for low funding from other sources and help to achieve a nearly average level of total revenues. Such an imbalance would be seen in the percent distribution figures, which would show a skewed deviation from national averages. The percent distribution chart at the bottom of the page can be used to gauge the importance of each individual revenue source. The type of institution strongly 84

affects the role of each source and the pattern of support.

In the public sector, state and local government appropriations and student tuition are two income sources that, in particular, should be carefully scrutinized in terms of both adequacy of dollar amount and relative share of total revenues. In some states, appropriations and tuition levels are quite inconsistent with national averages and should be reviewed with state objectives for support and equity in mind.

Institutional Expenditures. These expenditures reflect E&G current funds expenditures and mandatory transfers for the operations of the institutions. Again, as with revenues, expenditures for auxiliary enterprises, hospitals, and independent operations are excluded. The E&G expenditure components, briefly stated (they are more fully defined in appendix B), are as follows:

- Instruction expenditures of the colleges, departments, and other teaching units for all types of instruction as well as expenditures not separately budgeted for departmental research and public service are included in this category.
- Academic Support expenditures are for libraries, academic administration and personnel development, computing service, and other services that are an integral part of the institution's primary mission of instruction, research, and public service.
- Research includes funds expended for activities specifically organized to produce research outcomes, commissioned by an external agency or separately budgeted by the institution. Research expenditures are reported per faculty member.

- Public Service includes funds budgeted specifically for public service and expended for activities established primarily to provide noninstructional services to groups external to the institution.
   Public-service expenditures are reported per 1,000 individuals in the state's population.
- Other E&G Expenditures are for student services (admissions, career guidance and counseling, health), institutional support (general administrative services, planning, legal, and fiscal operations), plant operation and maintenance, student scholarships and fellowships, and mandatory transfers for auxiliary enterprises.
- Total E&G Expenditures is an aggregate dollar amount that indicates the relative importance of total funding for each institutional category as part of the overall sector budget.

The national average dollar amounts per student for the various types of institutional expenditures can be viewed as typical "costs" of education. Deviations from the national norm result from a whole set of institutional conditions that differ from the hypothetical "average" circumstances. Although differences in the variables affecting expenditures within institutional categories have been partially restrained by features common to the group, many individual institutional differences remain. Also, certain external factors (for example, an unexpected depletion or windfall in financial support or a substantial difference between projected and actual enrollments) occasionally occur that cause expenditures to deviate significantly from category norms.

Significant differences in the mix of expenditures from national averages should be studied for consistency with goals and objectives. Often, expenditure patterns are based on historical precedent and unadjusted trends, resulting in a profile that is inconsistent with the institution's current situation and mission. The percent-distribution table and the degree of variance from national averages can assist in an initial examination of this possibility.

#### Trends

The primary focus of the fourth and fifth data pages is trend data on enrollments, state and local appropriations, tuition and fees, and total E&G revenues (excluding grants and contracts). Changes in yearly growth for enrollments and state and local appropriations in current dollars are presented, as well as inflation-adjusted changes for state and local appropriations, tuition and fees, and total E&G revenues. The trend analysis has three additional components: enrollment mix, tuition revenues and instruction expenditures, and the mix of support provided from the various sources.

State and Local Appropriations and Enrollments. The table at the top of this first trend page provides FY82 state and local appropriation data and Fall 1981 FTE enrollment data by institutional category. The four-year percentage change from 1978 to 1982 is presented for state and local appropriations and enrollments. Yearly percent changes for 1981 to 1982, 1980 to 1981, and 1979 to 1980 are also shown.

Constant-Dollar Revenues. The consequences of inflation on appropriations, tuition and fees, and total E&G revenues (excluding grants and contracts) are shown

in the table on the second trend page. This table shows the four-year and yearly percentage changes in constant dollars per student for each of the three variables.

Since all absolute-dollar amounts have increased in recent years to meet the requirements of expanding enrollments and to offset inflation, the effects of these two factors must be excluded if a trend on the real adequacy of financing is to be established. Thus, dollar amounts are reported on a per-student basis, and constant dollars of equivalent purchasing power are obtained by dividing actual dollars by the Higher Education Price Index (HEPI). The HEPI measures average changes in the prices of goods and services purchased by colleges and universities through current-fund E&G expenditures (excluding expenditures for sponsored research and auxiliary enterprises). According to HEPI, the prices colleges and universities paid for goods and services show a 44. 3 percent rate of inflation between 1978 and 1982. 4

State and Local Appropriations. The diagram at the top of the first trend page depicts the data from the tables on the two trend pages. The solid line represents the percentage change in state and local appropriations (in actual dollars) to public institutions between 1978 and 1982. The dashed line plots the percentage change in public FTE enrollments between fall 1977 and 1981, the relevant academic period. The dotted line represents the measure of constant dollars per student, derived by dividing state and local appropriations adjusted for inflation (using HEPI) by FTE enrollments for 1978 through 1982. (1978 is the base year.)

Public Enrollment Mix and Independent Enrollment Mix. The distribution of FTE enrollments in 1982 by institutional type for the public and independent sectors is shown in the pie chart on the first trend page at the bottom of the left-hand side. The distribution of enrollments in 1978 is shown in parentheses.

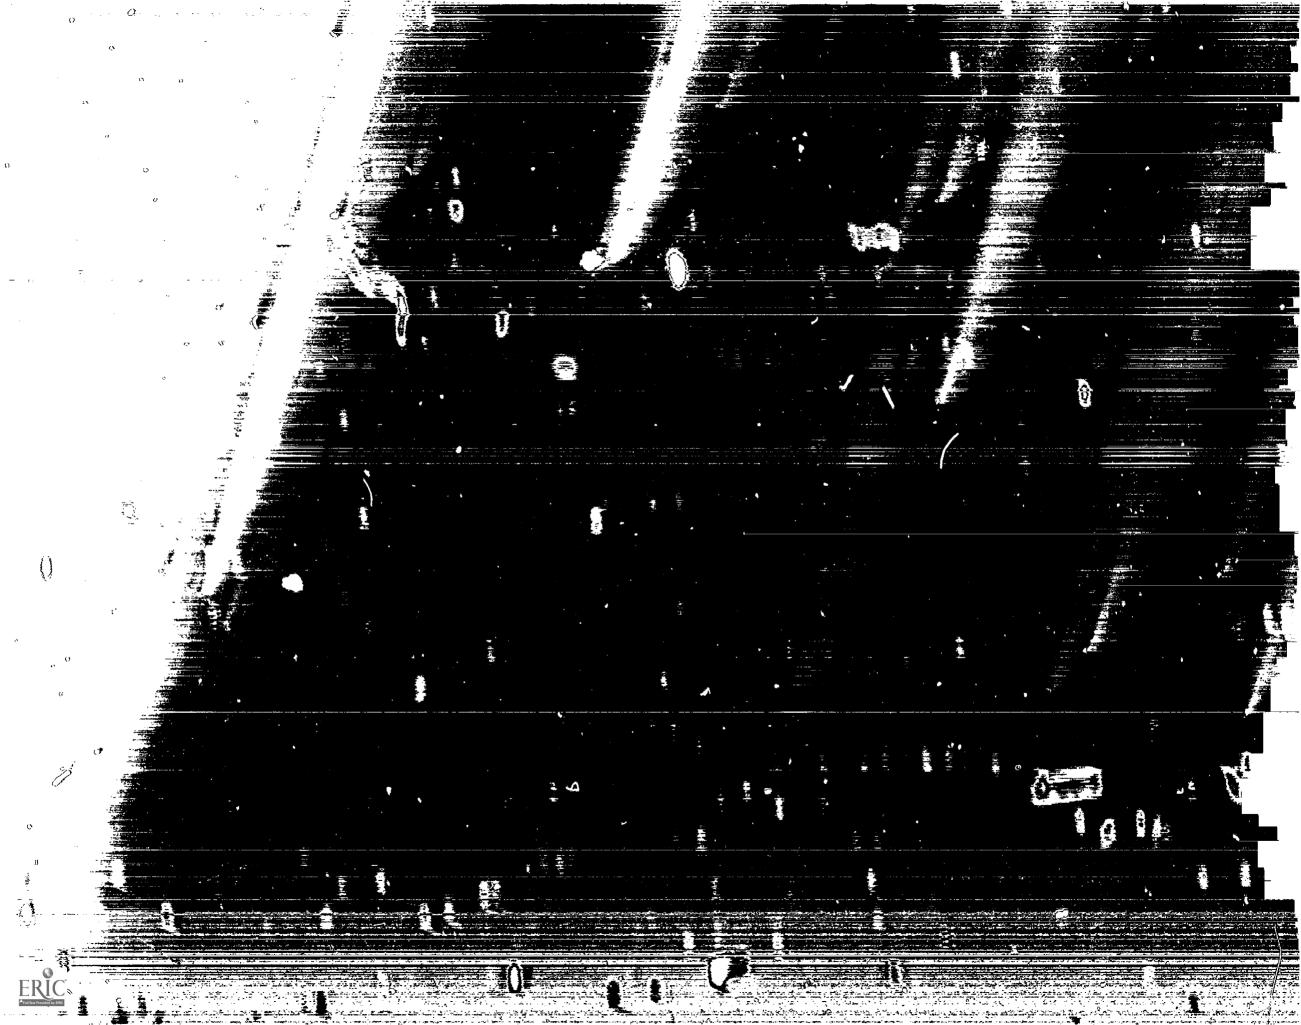

A Comparison of Tuition Revenues and Instruction Expenditures. In the lower portion of the first trend page are two bar graphs comparing tuition revenues and instruction expenditures for FY/18 and FY82 in constant dollars per student. The top graph portrays the public sector, and the bottom graph shows the independent sector. These graphs show data for tuition revenues and instruction expenditures from the second and third data pages and are presented for seven categories of institutions. (The research universities and universities combine data for medical and nonmedical institutions, and data for the health-professional schools are not displayed.) The solid/white column shows the dollars per student for instructional expenditures and the crosshatched column shows the tuition-revenue dollars per student. The percentages at the bottom of each box show the proportion of instruction expenditures that tuition represents in **FY78** and **FY82**.

Although no single indicator can explain and justify decisions regarding tuition levels, reference to instructional costs appears to be a most direct consideration.

Tuition primarily pays for instruction and related overhead costs of administration, library, and plant operation and maintenance. In the public sector, tuition revenues seldom equal these costs, with the share varying from state to state by institutional type. In the independent sector, tuition revenues almost always cover the majority of these costs. Decisions in setting the level of tuition are based on costs, family ability to pay, student demand as affected by price competition from other institutions, and state philosophy regarding the citizen's "right" to postsecondary

^{4&}quot;Higher Education Prices and Price Indexes: 1983 Update," (Washington, D. C.: Research Associates of Washington, September 1983).

## CHAPTER 3: STATE BY STATE REPORTS

Comparisons of funding patterns for all 50 states, the District of Columbia, and the U.S. average are described in this chapter. The state profiles, treated in alphabetical order, are the central focus of this study. The state profiles follow the summary of general patterns and trends for the nation.

# U.S. AVERAGE

#### Recent Trends

Between 1978 and 1982, state and local funding for public higher education grew in absolute terms by 44.2 percent. But after adjustments for inflation and for a 5.6 percent increase in public enrollments, this growth in funding was reversed and meant instead a reduction of 5.3 percent in constant dollars per student, including a loss of 3.6 percent in FY82 (the most recent year of data). The pattern of revenue changes by sector was fairly uniform, with eight of the ten sectors experiencing real-dollar erosion in state appropriations per student. The specialized institutions, including the health-professional and other specialized schools, had respective gains in funding of 7.0 and 15.1 percent. The two-year schools experienced the most serious losses -- 11.5 percent for the academic/comprehensive two-year schools and 7.3 percent for the occupational institutions. Large losses were also evident for universities without medical programs (8.2 percent).

In a somewhat counterbalancing pattern, tuition revenues improved in value between 1978 and 1982, by 1.4 percent. However, improvements in tuition were outweighed by losses in state appropriations, netting an overall drop (2.3 percent) in the constant-dollar value of revenues per student in the public sector.

Financial conditions in the private sector were more positive and showed an increase in the constant-dollar values of revenues, amounting to 3.7 percent per student. This included a .7 percent gain in FY82. All categories of private institutions shared in these improvements except the two-year occupational sector. That sector found its funding reduced by 14.8 percent.

#### State Financing of Higher Education

In 1982, state and local government support for higher education averaged \$108 per capita. Ninety-one percent of these funds were allocated to institutions in the form of general institutional support, and 4 percent went for state student aid. The remaining 5 percent was channeled indirectly to higher education as support for state higher education boards and commissions and other functions, including postsecondary vocational-technical education, fringe benefits, central services, and tuition reciprocity arrangements. Ninety-six percent of state funds for higher education went to the public sector, and 3 percent went to the independent sector. The remaining 1 percent was not identified by sector.

#### State Tax Base and Budget

In 1981, the states and localities collectively raised \$1,030 per capita in tax revenues. The largest single source of tax revenues in the states was general sales, which provided 235 percent of tax revenues. The next largest source was individual state income taxes, which accounted for 19.2 percent of tax funds. Residential property taxes yielded

17.3 percent of state tax revenues, followed by selective sales and gross receipts at 11.9 percent, and commercial and industrial property taxes at 10.2 percent. These five tax categories provided \$2 percent of state and local tax revenues.

U.S. Census Bureau data on the distribution of these funds indicate that in 1982 elementary/secondary education received the largest single share at 26.1 percent. This was followed by public welfare at 13.0 percent, public services at 11.6 percent, higher education at 9.6 percent, highways at 7.9 percent, and health and hospitals at 9.3 percent. The remaining funds (22.6 percent) were used for a variety of other state functions. A comparison of 1982 state spending patterns with those of 1978 indicates that public welfare, health and hospitals, and other miscellaneous services received increased shares of state budgets, whereas elementary/secondary education and highways received less. Shares allocated to both higher education and public services were unchanged during this period.

#### **Higher Education Enrollments**

Three-quarters of the 8.9 million FTE students in this country attended public institutions of higher education in fall 1981. Thirty-one percent of all students attended two-year institutions, another 31 percent attended universities, 24 percent attended comprehensive master's-granting institutions, and 10 percent attended baccalaureate colleges. The remaining students enrolled at specialized institutions. There were small gains in public higher education enrollments between 1978 and 1982, with enrollments growing by 5.6 percent. (In part these gains are due to the increasing number of institutions encompassed within the reporting universe.)

Most students attended college in their cwn sta'e, 73 percent of them going to public institutions and 18 percent to private institutions. Only 9 percent of all students went out of state for higher education. Thus even at independent institutions, on average, 60 percent of the students were residents of that state.

#### Institutional Finances and Characteristics

Public and independent institutions finance their activities in very different ways. At public institutions, state and local appropriations constitute the major share of funds, providing 59 percent of all educational and general revenues. The importance of state and local funds at public institutions fell slightly between 1978 and 1982, from 60 percent to 59 percent of all E&G funds. By contrast, independent institutions received only 2 percent of their funds from state and local sources. Private institutions instead relied primarily on tuition for their funds, receiving 51 percent of their total revenues from this source. These institutions received 12 percent of their revenues from private gifts and grants and 7 percent from endowment income. Public institutions received only 11 percent of

their funds from those sources (17 percent from tuition and 4 percent from private gifts and endowments). Government grants and contracts were roughly similar in importance at public and private institutions, representing 13 percent and 18 percent of respective B&G revenues.

For public institutions, tuition is carrying an increasing share of costs in order to compensate for diminishing state appropriations and government grants and contract funding. In the independent sector, tuition also is carrying a greater share of support, to ameliorate reductions in government grants and contracts and private gifts and grants.

Public institutions spent a greater share of their funds on instruction and public service than did private institutions—44 percent and 5 percent versus 37 percent and 2 percent. Independent institutions spent larger shares on institutional support activities than the publics (42 percent versus 31 percent), while the shares going to research and academic support were similar for both types of institutions.

Between 1978 and 1982, public institutions showed real-dollar erosion of 2.3 percent in E&G revenues per student, while independent institutions experienced a real gain of 3.7 percent. For public institutions, this drop was due largely to reductions in state funding (amounting to 5.3 percent per student). For the independent sector, net gains in tuition of 2.8 percent were responsible for moving total revenues ahead, even in the face of a large 10.6 percent gain in enrollment. Public sector enrollments grew more slowly, at 5.6 percent.

Losses in spending power were prevalent throughout the public sector except for the specialized institutions (net revenues of health-professional institutions moved ahead by 9.8 percent, and there were gains of 23.1 percent for the other professional institutions). By contrast, gains in funding support were consistently evident in the independent sector except for the small two-year occupational sector (which had losses of 14.8 percent net of inflation).

On average, public institutions were nearly three and one-half times larger than private institutions and placed greater emphasis on lower division studies. Private institutions enrolled 1,343 students on average (compared to 4,533 for public institutions) and focused more on the graduate level (19 percent of private students studied at the graduate level versus 9 percent of public students). Institutions in both sectors grew slightly larger on average. Faculty generally were better paid at public institutions, although there were important variations by both sector and rank. From 1978 to 1982, faculty salaries grew 36 percent in both sectors. The Consumer Price Index, however, increased by 50.2 percent in this same time period, iodicating that the general purchasing power of faculty salaries fell.

## **ALABAMA**

#### Recent Trends

Alabama found its public support to higher education increasing more slowly than the national average between 1978 and 1982. Appropriations to the public sector increased by 33.6 percent, a rate nearly 25 percent below average. During this same period, enrollments grew by 5.9 percent, isaving a 12.6 percent net constant-dollar decline in state and local appropriations for Alabama's public institutions. Alabama reflected the national pattern of loss in spending power from state sources, but the losses in Alabama were more severe. On average, U.S. public institutions saw the value of their state funding drop by 5.3 percent, with all but 16 states incurring some loss. In Alabama, the decline reached 12.6 percent and was worse in only 15 other states. All institutional sectors in Alabama except the public general baccalaureate schools experienced a loss in overall purchasing power during this period, ranging in size from 5.8 percent to 9.8 percent.

These losses in state funding further eroded Alabama's position nationally in terms of per capita support for higher education, which has drupped from 22 percent above average in 1979 to just 4 percent above average in 1982. Alabama-spends \$112 per capita for higher education, compared to the U.S. average of \$108 per capita. Still this is a notable level of support, in light of Alabama's low tax base. The state collects less in taxes than any other state except Arkansas, netting \$694 per capita in contrast to a national average of \$1,030. As a result, the state operates its public enterprises with 33 percent fewer funds than the average state.

Although Alabama provides 4 percent greater funding to higher education than average, these funds must support a larger than average number of students at public institutions, including a separate vocational-technical sector. Alabama educates 31.3 FTE students in its public institutions per 1,000 persons in the state, 7 percent more than is typical. In addition, these students are enrolled in relatively more expensive types of institutions. Students are registered in large numbers at universities and comprehensive institutions, and to a much lesser degree at two-year institutions (27 percent versus a national average of 38 percent). The result is a dilution of slightly above-average state support, causing Alabama to shift from an above-average ranking (by 4 percent) in per capita support to a below-average position (8 percent lower) in terms of funding per student.

#### State Financing of Higher Education

As noted, Alabama spends \$112 per capita for higher education. This level of support is lower than the previous year, as spending dropped from \$114 per capita in FY81 to \$112 in FY82. Almost all of these funds (99 percent) support the public sector. Bighty-six percent is distributed

directly to institutions for general institutional support; 1 percent is allocated for student aid; and an unusually large portion (13 percent) supports higher education in other ways, primarily going to vocational-technical education. This distribution substantially reduces the total percentage of general support received by public institutions directly. Still, general institutional support per capita (not per student) is almost equal to the national average.

#### State Tax Base and Budget

Alabama's economic capacity to collect tax revenues is among the lowest of the states, at \$767 per capita, indexed at 75. Only Mississippi has a smaller base of financial activity to tap. All of the major types of tax categories (sales, income, and property) exhibit substantially below-average capacity. Compounding this problem, Alabama makes a very modest tax effort (9 percent below average), resulting in tax revous of \$694 per capita (a level 33 percent below the national average) and the second-smallest pool of public funds of any state. Alabama relies heavily on sales taxes for revenues and makes very little use of property taxes. In 1981, Alabama could have collected an additional \$515 million in property tax revenues, had property in this state been taxed at the rate of the national average.

Apparently higher education is only minimally affected by this small tax base and is accorded a relatively large share of the state budget. Census data (which include both tax revenues and federal revenue-sharing funds) indicate that 13.0 percent of the state's budget is spent on higher education, a level substantially above the U.S. level of 9.6 percent. (From 1978 to 1982, higher education in Alabama saw its share of the state's budget increase slightly, from 12.8 percent to 13.0 percent.). Health and hospitals (12.8 percent) and highways (9.5 percent) are also comparatively well funded in Alabama -- at the expense of public welfare, public services, and general state functions, each of which receives 13 to 30 percent less than the national average. The share of state and local funds allocated to elementary/secondary education fell somewhat, from 27.8 percent of the budget in 1978 to 26.9 percent in 1982. In sum, higher education has to to considered a state priority because it receives such a relatively large share of the exceptionally low tax revenues generated.

#### Higher Education Enrollments

Although relatively fewer residents of Alabama attend higher education institutions anywhere (87 percent of the national rate), the public sector serves a near typical number of state residents: 25 per 1,000 capita. However, only half of the normal number of state residents enroll in private institutions in the state or go out of state to any institution. It is low participation in these sectors that reduces total rates of postsecondary attendance to 13

percent below average. Total enrollment at public institutions, however, is 7 percent above average because of substantial migration of students from other states (almost 70 percent above average) and greater numbers of full-time students.

In general, Alabam a's public students are more likely to attend universities and comprehensive institutions than two-year schools, which creates a relatively more expensive system to operate. By contrast, students enrolling in Alabama's independent sector are concentrated in general baccalaureate schools and comprehensive institutions.

#### Institutional Finances and Characteristics

Alabama supports 37 public institutions of higher education: 2 universities, 12 comprehensive, 2 baccalaureate, and 21 two-year institutions. Funding for the University of Alabama -- Tuscaloosa (both from the state and in total) approximates the national average. However, in light of the greater amount of graduate study at the University of Alabama -- Tuscaloosa, these funds may be inadequate. Revenues at this institution are supplemented with above-average government grants and contracts. At Auburn University (research university with medical), state funding per student and total operating support (excluding government grants and contracts) are both below average, by 22 percent and 14 percent respectively. By contrast, the comprehensive institutions show above-average funding both from the state and in total. The baccalaureate and two-year schools, however, function with funds 20 to 30 percent below typical levels. largely because of below-average state support and lower tuition. Further, Alabama's institutions in general are smaller and more graduate oriented, a costly combination that dilutes existing apport.

Institutional reliance on state support continued to fail in Alabama, dropping from 59 percent in FY79 to 55 percent of total revenues in FY82. Tuition continued to be a more important revenue source for public institutions in the state, growing from a 14 percent share in FY79 to an 18 percent share in FY82.

Although real-dollar funding has slipped in the public sector, for the independent sector there was a 14.4 percent net galn in real-dollar purchasing power per student between 1978 and 1982, tied primarily to finances of the private general baccalaureate institutions.

The recent public-sector losses in overall funding were evident in the salaries paid faculty in Alabama in the public sector. Salaries continue to lag behind national averages and showed a loss in relative position in FY\$2. For the public sector as a whole, they trail by 16 percent, with some inatitutional sectors behind by as much as 23 percent.

## **ALASKA**

#### Recent Trende

State and local appropriations to higher education rose 74.3 percent in Alaska between 1978 and 1982, which was nearly 70 percent better than the U.S. average. This surge in state funding not only allowed institutions to accommodate nearly 7 percent more students but also nstted a 13 percent improvement in real-dollar state support per student to public institutions. When other revenue sources are considered, the total operating base of public institutions in Alaska increased by nearly 17 percent on a per-student basis. This represents the second-largest improvement among the states. Only Oklahoma gained more in inflation-adjusted revenues per student. Although the significantly higher prices in Alaska compared to the rest of the U.S. temper these findings, the direction of change is encouraging. However, how much of this change is price related and how much is true gain is not discernible. While the four-year trend in Alaska is encouraging, much of the improvement occurred in FY\$0. Since then, the value of state funding and total funding has fallen in real-dollar terms. In fact, FYS2, Alaska was one of 33 states experiencing a decline in the per-student purchasing power of state funding. Constant-dollar state appropriations per student fell 5.2 percent, and the value of funds from all sources dropped even further -- by 11.4 percent. Only Wyoming and the District of Columbia had sharper losses in the value of total funding.

#### State Financing of Higher Education

Still, Alaska spends \$367 per capita for higher education, a level more than three times the national average. Seventy-eight percent of this support is funneled directly to public institutions in the form of appropriations, and most of the remainder is provided for student aid. The remaining share (3.5 percent) provides indirect assistance to higher education, primarily for postsecondary vocational-technical education.

#### State Tax Base and Budget

Alaska raises nearly six times more tax revenues than the typical state because of inherent wealth and a strong tax effort. Alaska has a tax capacity more than three times greater than most states. This is evident in many tax categories, especially severance taxes (index 5919), individual and corporate incomes (indexes 203 and 176 respectively), and residential and industrial properties (indexes 133 and 179). The state makes the most use of its capacity in the arsa of severance taxes (ranks 2nd), obtaining an astounding \$6 percent of its revenues from this source alone. According to the Census Bureau, Alaska spends a total of \$8,673 per capita in state funds, four and one—half times the national level. Alaska's spending priorities are most evident for

public services and other miscellaneous categories. By contrast, public welfare and health and hospitals receive very small shares of the state budget, shares that are 62 to 66 percent below average. Blementary/secondary education also receives a below-average share, smaller by nearly 30 percent. Only 6.4 percent of state funds are allotted to higher education, a rate 33 percent below average. Still, because of the size of the state's tax base, higher education receives funding (in dollars per capita) that is more than three times the national level. Higher education's share of the state budget is unchanged from 1978.

#### Higher Education Enrollments

Fewer Alaska residents enroll in higher education than is typical nationally, by 11 percent. More than twice as many Alaskans attend college in other states (compared to the national average). Enrollment of residents within the state at public institutions is just slightly below average, and their enrollment at independent institutions is minimal.

The state's public institutions enroll 8 percent fewer students than is typical. Despite typical numbers of high school graduates, there is low attendance by first-time resident students (one-quarter the average) and a large proportion of part-time students. High student-persistence rates and abovs-average numbers of nonresidents compensate to a major degree, leaving Alaska's enrollment just 8 percent below average in 1982. Very few Alaskans attend independent institutions within the state. The majority of students in the state enroll in either the two comprehensive institutions or the nine two-year institutions. In absolute terms, the actual number of students in public institutions is very small: 11,182 FTE in total.

#### Institutional Finances and Characteristics

Although price differences cloud the interpretation of financial data from Alaska, public institutions in the state operate with revenuss that are generally three to four times national levels. At the comprehensive institutions particularly, funding is more than four times national rates, averaging almost \$18,000 per student. In addition, Alaska receives an exceptional number of government research grants, a further contribution to the state's funding base. Yet, despite substantial research activity at comprehensive institutions, graduate enrollment at them is only slightly higher than the national averags.

Institutions in Alaska are exceptionally small, usually enrolling only 900 plus students, one-fifth the norm. Faculty salaries in Alaska's public sector are nearly 50 percent above the national average.

# **ARIZONA**

#### Recent Transa

The 13.1 percent increase in state appropriations to Arizona's public institutions in FY82 was more than sufficient to cover both enrollment increases. and inflation. Arizona's public institutions had real-dollar gains in total funding per student of 2.1 percent, based on a 2.2 percent gain in constant-dollar state funding and 2.3 percent gain in inflation-adjusted tuition revenues. When seen against a national backdrop, these improvements in funding in Arizona are especially impressive. Nationally, public institutions saw their purchasing power drop overall by 2.0 percent, and by 3.6 percent in terms of state funding. Arizona by contrast was one of 16 states that experienced real improvements in its operating base.

These one-year gains in state and local appropriations to public institutions continued a trend. From 1978 to 1932 state and local appropriations outpaced both inflation and enrollment growth in Arizona. The 50.7 percent increase in state funding created a 2.1 percent real-dollar gain in finances, even with a 2.2 percent increase in enrollments. Coupled with a 22.5 percent advance in constant-dollar tuition revenues. Arizona institutions experienced a nearly 10 percent constant-dollar increase in their total E&G revenues per student. As a result, Arizona was among the 16 states achieving real-dollar gains in state support per student, and among the 20 states with gains in total funding for the public sector for this time period.

Arizona's gain in constant-dollar total revenues of 9.6 percent between 1978 and 1982 contrasts sharply with the 2.3 percent loss experienced nationally. Clearly Arizona's recent financial conditions have been more favorable than those of the rest of the nation.

#### State Financing of Higher Education

Arizona spends \$165 per capita for higher education, a level 53 percent above the national average. As a result, Arizona is 2nd in the country in its support of higher education, outranked only by Alaska. These funds are being spent in the public sector, almost entirely in the form of direct institutional appropriations. The state student-aid program is small in Arizona.

#### State Tax Base and Budget

Arizona ranks 37th nationally in tax capacity. However, through a substantial tax effort, Arizona collects taxes that are 6 percent greater than the national average, resulting in \$967 per capita for public purposes in 1981. Arizona raises 68 percent of these taxes through above-average general aales taxes and property taxes.

In Arizona's budget, higher education, public services, highways, and elementary-secondary education receive above-average shares of the state pie. Higher education in particular is favored, receiving 15.0 percent of the state'e budget, a level 57 percent above the national average. Further, this share increased from 1978, when it was 14.4 percent of the state's budget. By contrast, public welfare and health and hospitals receive shares of the state budget that are very low by national etandards.

#### Higher Education Enrollments

Arizona residents achieve very high rates of access to higher education, ranking the state 1st in the nation Forty-three of every 1,000 persons in the state enroll, a level nearly 30 percent above average. Public institutions of higher education in Arizona are the primary means of access, and they enroll 54 percent more state residents than is typical. Very few Arizonans attend independent institutions in the state, and half as many Arizonans as average migrate to other states for postsecondary education.

In total, Arizona's public institutions of higher education enroll 79 percent more students than the average (52.3 FTE students for every 1,000 persons in the state), more students per capita than any other state. The entrance rate for first-time students is more than three times the national average, including a very substantial in-migration of students from other states (nine times the rational rate, and more than any other state). However, students in Arizona more often attend higher education institutions on a part-time basis and for shorter durations than students in other states, thus lessening somewhat the strong enrollment demand. Nevertheless, the state has more access for its own residents and for students in general than any other state.

Far more students enroll in research and doctoral institutions in Arizona than is typical. Forty-five percent of the state's public students are in universities, in contrast to the national average of 32 percent. Similarly, Arizona places more emphasis on two-year institutions, and 46 percent of the state's students enroll in this sector, in contrast to the U.S. average of 38 percent. Most postsecondary students enroll in universities or two-year institution.

#### Institutional Finances and Characteristics

In 1982, despite recent improvements in funding, per-student revenues overall in Arizona were below the levels received by similar public institutions, largely because of below-average state funding. There

were, however, major variations in this general profile by type of institution. The research university, the University of Arizona, received average funding from the state but. overall, operated with revenues 10 percent less than average because of lower tuition revenues. The large academic two-year institutions, while better funded. functioned with about 4 percent less than the average for comparable schoole. All other public sectors had above-average funding. The university with no medical programs, Arizona State University, received about 2 percent more per student from the state and, overall, had 3 percent more revenues than similar inetitutions. The two-year occupational institution in the state operates with funding that is 18 percent better than average. Northern Arizona University (reclassified in this edition as a comprehensive institution) operates with 13 percent more funding per student than similar institutione.

The University of Arizona (medical research university) spende less on instruction and more on academic support and public service than is typical of such institutions. Arizona State also has a large academic support and public-service component and spends slightly more on research than other institutions in this category.

Generally, institutions in this state are larger than average and more graduate in character. The University of Arizona, with 26,657 students, is about 10 percent larger than other research universities with medical schools. Arizona State University, with 29,496 students, is more than twice as large as schools of its type. The University of Arizona is also more graduate in its focus (22 percent of its students study at this level) than is Arizona State University, which enrolls about 11 percent more graduate students than is typical of such schools.

Faculty salaries in Arizona are 10 percent above national levels and improved markedly between 1978 and 1982, particularly for the upper ranks.

(indexes shown in bold are based on U.S. average = 100)

## **ARKANSAS**

#### Recent Trends

In fiscal year 1982, inflation outstripped a 6.5 percent increase in state funding for public higher education in Arkansas. In constant dollars, this represented a 1.4 percent drop per student in state appropriations. Tuition revenues, however, increased by 5.3 percent. Consequently, total E&G revenues (excluding government grants and contracts) per student in constant dollars decreased by .4 percent.

Between 1978 and 1982, higher education institutions in Arkansas experienced a net decrease in state and total support. The state increased appropriations for public higher education by 39 5 percent from 1978 to 1982 (slightly below the national average), but because of above-average enrollment growth of 6.1 percent and an inflation rate of 44.3 percent (HEPI), appropriations in constant dollars per student fell 8.9 percent (compared to 5 3 percent nationally). From 1978 to 1982, the state's public institutions increased tuition revenues 77 percent, resulting in an increase of 15.2 percent in constant dollars per student, 9th highest in the nation. These large increases in tuition offset to some degree the loss from appropriations, so that total educational and general expenditures per student in constant dollars declined only 3.5 percent Faculty salaries increased 36 percent during the four years, equal to the national rate. However, given the 502 percent increase in the CPI during this time, faculty in the public sector lost 10 percent of their purchasing power.

Between 1978 and 1982, the 15 independent institutions in the state increased tuition revenues per student in constant dollars by 8.3 percent, well above the national average of 2.8 percent. However, they could not increase revenues from other sources proportionately, and as a result, total educational and general expenditures per student in constant dollars declined 5.8 percent. This compares to a national average increase of 3.7 percent. Faculty salaries increased only 32 percent, 11 percent below the national average.

#### State Financing of Higher Education

Arkansas operates a relatively small public higher education system, enrolling 22.9 FTE students per 1,000 population in FY82, compared to the national average of 29.2 per 1,000 population. Total per capita appropriations for higher education of \$77.50 were low, with a state rank of 42nd. However, given below-average enrollment, appropriations per student were \$3,344, equal to the national average and ranking Arkansas 22nd. Revenues from other sources, including tuition, did not materially improve total funding relative to national averages.

The state also appropriated \$1.5 million for student aid and \$7 million for state boards and commissions. State funds were not used for the operation of independent institutions.

#### State Tax Base and Budget

Arkansas is a relatively tax-poor state and had a potential tax capacity of \$840 per capita in 1981, 18 percent below the national average of \$1,030. The state ranked 43rd in the nation in tax capacity (an improvement over its 1980 ranking of 47th). This position was the result of low tax potential in individual income (60 percent of the national average), corporate income (77 percent), and residential and commercial property (69 percent and 70 percent).

The tax effort of Arkansas was also low, 21 perceut below the national average tax rates, with a state rank of 43rd. (In 1980, the tax effort was 15 percent below average, a rank of 37th.) Arkansas lost \$295 million because of low property taxes and \$98 million because of below-average general sales taxes. As a result, collected tax revenues of \$663 were 36 percent below average, ranking the state last (51st) in the nation in tax funds available to support public services. Collected tax revenues in 1981 exceeded collected revenues in 1980 by only \$22 per capita.

Arkansas allocated 12 percent of its tax revenues to higher education, above the U.S. average of 11 percent (index 112). However, because of low tax collections, the resulting appropriations of \$78 per capita for institutional support, student aid, and other support were 28 percent below the national average (42nd in the nation).

If the operating budget of the state is taken as a whole (including nontax and federal revenues), highways received the largest share of the budget relative to national averages, followed by health and hospitals and education. Public services (police, fire, sewerage, and parks) received a disproportionately low share compared to national averages.

#### Higher Education Enrollments

Arkansas, with 25 students per 1,000 population, ranked 49th in the number of students attending college anywhere. The 1982 national average was 34 per 1,000 population. A large majority, 84 percent, attended public institutions within the state; 12 percent attended independent institutions in state; and 4 percent attended out of state. The national distribution was 73 percent, 18 percent, and 9 percent respectively.

The colleges and universities of Arkansas enrolled 63,022 FTE students in fall 1981, making higher education a small enterprise relative to the state's population. The public sector was proportionately larger than the private sector (83 percent versus 17 percent), compared to the national average (76 percent versus 24 percent). University enrollment as a share of total public enrollment was proportionately smaller than the national average (26.8 versus 32.1 percent); four-year college enrollment much larger (55.9 versus 28.3 percent); and two-year college enrollment proportionately much smaller (14.9 versus 37.8 percent).

In 1982, Arkansas had an average number of high school graduates per capita compared to the nation, but only 43.8 percent entered state public institutions. The entrance rate, nationally was 62.5 percent. In-migration of nonresident students per 1,000 population was 9 percent less than the national a erage. Retention was slightly less than average, and part-time enrollments were also lower than average. Residents made up 56.8 percent of the enrollment at independent institutions in Arkansas, whereas the national average was 60.4 percent.

#### Institutional Finances and Characteristics

The largest public enrollment (20,472) was at the state's four comprehensive colleges, which received the lowest appropriations per student relative to national averages. Thus, total educational and general revenues (excluding government contracts) at the comprehensive institutions were 17 percent below average. These institutions also had correspondingly low expenditures.

The University of Arkansas, which enrolled 14,070 students in fall 1981, received tuition revenues 26 percent below the national average for research universities without medical programs. High revenues from other sources increased total educational and general revenues to near the national average. The university emphasizes public service and research at the expense of student instruction, which was funded 29 percent below average. The university ranked last among all research universities in this respect.

The state's four baccalaureate colleges, errolling \$,944 students, had nearly average total funding. Like the university, however, they underfunded instruction per student—by 15 percent. Again, research and public service were financed well above average for this type of institution.

The seven two-year academic colleges, with enrollments totaling 6,175, received above-average tuition revenues, yet funded instruction per student at i3 percent below the national average. Academic support, in contrast, was funded 30 percent above average.

The state's seven independent baccalaureate colleges, which enrolled 7,873 students, received tuition revenues that were 36 percent below average. Endowment funds made up some of the difference; nevertheless, total educational and general funding fell 44 percent below average. As a consequence, expenditures were substantially helow average. For example, instruction per student was supported at 13 percent below the national average.

## **CALIFORNIA**

#### Recent Trends

For California's system of public higher education, fiscal year 1982 was marked by a significant drop in constant-dollar per-student funding. Only four other states fared worse than California, where inflation-adjusted state and local appropriations per student plummeted 12.0 percent. Thitiog increases ameliorated these losses to some degree; still, the purchasing power of total revenues (except government grants and contracts) in California's public sector dropped 8.9 percent from 1981 to 1982. All sectors of public institutions suffered these losses except the specialized institutions. Losses in overall purchasing power ranged from 4.7 percent at the research universities (with medical programs) to 10.8 percent at the academic/comprehensive two-year institutions.

The constant-dollar losses in Californ's from 1981 to 1982 left the state's public sector with an overall four-year profile (1978 to 1982) of a 6.8 percent drop in per-student purchasing power. The losses in the two-year sector are most notable, 18.9 percent at the academic/comprehensive two-year institutions and 25.0 percent at the occupational two-year schools. Losses in the university sectors and the comprehensive institutions were much less by comparison, ranging from .5 percent to 2.7 percent. For the research universities (without medical programs), the 1978-x² period meant small real gains in spending power of 3.6 percent.

#### State Financing of Higher Education

California ranked 5th in the country in its funding of higher education in 1982. On average, each citizen of the state provided \$151 to support higher education, a rate 40 percent above average. Ninety-eight percent of these funds were channeled directly to the public sector, with 95 recent distributed through direct appropriations to public tutions. Three percent was channeled to students in the for 1 of student aid, and 2 percent provided other indirect support to higher education. California was among the 33 states that provided student aid to students attending independant institutions.

#### State Tax Base and Budget

California is one of the wealthiest states in the nation and ranked 8th among the states in 1981. Its tax capacity, 15 percent above the norm, is heavily centered in the traditional tax sources: general sales, residential property, and individual inform. Tax rates fell in recent years in California, in 1977, they were 20 percent above average, and in 1961 they had shifted to a level equil to the U.S. average. Still, given the strong inherent economic strength of the state, California's state and local government operates with a pool of tax revenues that is 16 percent above average and 8th largest in the nation on a per capital basis—\$1,190 per person. Although this base is still large by potional standards, it does represent some significant

belt-tightening within the state. In 1978, the state operated with funds that were one-fifth larger than average; in 1982, it functioned with one-sixth more than the average.

California allocated an above-average share of state revenues to higher education: 11.1 percent of its total state budget (from all sources, including federal revenue-sharing funds) and 13 percent of its tax-derived budget. Other state priorities were evident in the large shares accorded public welfare and public services. On the other hand, state emphasis declined substantially in elementary/secondary education, dropping from 25.8 percent of the total budget in 1978 to 22.6 percent in 1982. Health and hospitals, although receiving a somey hat smaller share of the state budget than average, increased their slice of the state pie during this period, from 7.5 percent to 8.9 percent. Highways continued to be a low priorit; and, at 4.4 percent of the budget, receive almost half of the average share.

#### Higher Education Enrollments

California is the most populous state in the nation and enrolls more students in higher education than any other state. In 1982, 40 of every 1,000 Californians attended postsecondary education institutions, a rate 19 percent above the U.S. average of 34 per 1,000. This high rate of access was due primarily to the state's public system of higher education, which enrolled 35 percent more respect to than did the public systems of other states. California rank '5th nationally in rates of access for its citizens. Californians show satisfaction with their public system of education. They attend independent institutions in the state at a rate almost 20 percent below national rates, and the number of Californians selecting institutions outside their home. 'ate is proportionately very small. (The number is less than 1 percent.)

California educates students (from both in and out of state) in its public institutions at a rate 39 percent higher than average. The een allments are the result of an extremely high entrance rate for first-time resident students (85 percent above average), above-average in-migration from other states (14 percent above average), and relatively high retention rates (9 percent above average). Although these 1982 rates of access are ubstantially above the national average, still they represent a major decline from 1975. At that time, FTE enrollments were 47.1 per 1,000 population in public higher e ucation. By 1982, the rate had decreased to 40.5 per 1,000, a fall of 14 percent.

California provides access through a tiered system of un versities, state colleges, and community colleges. And, in marked contrast to national patterns, California provides its high rates o student access primarily through community colleges, which enroll 61 percent of all public students. This share is much larger than the proportion (38 percent) typic ally educated in public community colleges in the United States. On the other hand, California enrolls only 13 percent of its students in universities, in contrast to the

national average of 32 percent. California's 26 percent enrollment in comprehensive institutions is similar to patterns in other states. In summary, then, California has a very substantial commitment to access and, with its emphasis on a two-year college education, provides a relatively inexpensive way to achieve it.

#### Institutional Finances and Characteristics

California supports 135 public institutions. The state provides 47 percent more funds than average to educate a pool of students 39 percent larger than average. In addition, California's combination of heavy emphasis on two-year education and lesser emphasis on university-level education creates an educational system that on average is less expensive to operate than those in most states. The result is a system of public education that is very well supported by the state, at levels that range between 8 and 189 percent above average per student. The health-professional institution is the only exception: it receives funds per student from the state that are 20 percent less than the national average.

Largely as a result of this substantial state funding (representing 67 percent of all B&G revenues, which are then supplemented by funding from other sources), each of California's public institutional sectors except the two-year institutions operates with total B&G revenues per student (excluding grants and contracts) that are substantiallabove average. California's three university sectors are ranked in either first or second place in terms of E&G funding. The academic/comprehensive two-year sector is funded at levels 8 percent below average, while the occupational two-year sector functions with 13 percent less per student than average. At the comprehensive institutions, state and local appropriations per student are substantially above average, while tuition and private-gift revenues are significantly below. Still, comprehensive institutions in California operate with 6 percent more per student than the national average for similar institutions in other states. Tuition and fee revenues in the two-year sector (at \$83 and \$91 per student in the academic/comprehensive and occupational sectors) are approximately 85 percent below average and are no doubt a significant factor in the high access rates in this segment.

Above-average revenues translate into above-average expenditure patterns in most cases; public-service activities and other E&G expenditures are the exception. Faculty salaries are 21 percent above average. These pay rates reflect the above-average salary increases in California between 1978 and 1982 that addressed the salary erosion of prior years. California ranked 16th in the nation in faculty salary gains. Notably, faculty pay rates in the community colleges are seemingly unaffected by the below-average operating budgets in that sector. In fact, the occupational schools, with a per-student operating budget of 13 percent below average, have salary rates that are 39 percent above average.

#### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the MEGIS institutional finance report are shown here. The amounts whom below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$100,089.000*
Postsecondary vocational-technical education	\$ 77,108,446 (40,083 units of average daily attendance)
State boards and commissions	\$ 6.952.000
Retirement benefits (including social security)	<b>\$</b> 0
Fringe benefits ·	• 0
Interstate contracts and reciprocity payments	• 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	\$ 0
Centrally administered capital/debt service	• 0
Other	<b>\$</b> 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the REGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current funds revenues dedicated to capital purposes:

tuition and fees	1	0
auxiliary enterprises	1	0
other	1	0

Tuition and Fees reappropriated by the state? Yes ***

#### Other Connents

- * Approximately \$12 million included in this amount are federal funds.
- ** Hone for the state. State provides construction funds on an appropriation basis. Universities and state colleges have revenue bonds for non-state supported facilities Connunity college debt service (bond interest and redemption) is \$27,294,540, primarily from property tax revenues generated specifically for these projects.
- For the University of California, non-resident tuition is considered an offset to the state's General Funds. Student fees for residents are kept by the University. At California State University, resident student fees and non resident tuition are reinbursements to the state's General Fund. At the community collegee funde are retained at the district level and are not accounted for at the state level.

CPEC reports that state and local appropriations to public institutions in FY82 were \$3.6 million instead of \$3.4 million as reported by the institutions.

Source: California Postsecondary Education Commission

23.1

### **COLORADO**

#### Recent Trends

In fiscal year 1982, there were small but real improvements in the funding base of Colorado's public institutions. A 14.2 percent increase in state appropriations translated into a 2.4 percent gain per student in constant dollars, after adjustment for enrollment shifts and inflation. Tutton increases were slightly less than inflation, though overall there was still a 1.1 percent improvement in the total funding base per student. There were major sector differences in funding, with six of the nine public sectors showing some improvement in the purchasing power of their funds and three others facing some retrenchment (of from 4 to 6 percent). These gains followed two consecutive years of funding retrenchment.

State and local support to public higher education in Colorado rose to \$278 million in FY1982, a 43.2 percent increase from 1978 -- roughly average. A concurrent enrollment increase of 3.1 percent was less than the national average, but combined with inflation of 44.3 percent (HEPI), it reduced appropriations in constant dollars per student 3 8 percent. This compares to a 5.3 percent average loss nationally. Revenues from tuition increased 4.8 percent during this period, more than offsetting inflation (nationally, tuition revenues increased 1.4 percent). Still, the value of total funding per student slipped 1.2 percent between 1978 and 1982, due to the impact of inflation and enrollment growth. Faculty salaries at public institutions increased 37 percent during the four years. However, when adjusted to reflect the 50.2 percent increase in the CPI during this time, faculty suffered a 9 percent loss in purchasing power

The state's 18 independent institutions failed to increase tuition sufficiently to keep pace with inflation, with tuition per student in constant dollars declining 6.6 percent from 1978 to 1982. By contrast, independent institutions nationally increased tuition in real-dollar terms by 2.8 percent. Colorado's independent institutions partially made up for this loss by increasing revenues from other sources. As a result, total educational and general revenues per student in constant dollars declined only 3.9 percent. Faculty salaries increased 3.9 percent during the four years, with a loss in purchasing power of 7.5 percent.

#### State Financing of Higher Education

Colorado operates a very large public higher education system, enrolling 371 FTE students per 1,000 population in FY82, compared to the national average of 29.2 per 1,000 population. Yet the state appropriated below-average funding per capita for higher education (\$10140), a state rank of 28th. Thus, appropriations per student of \$2,509 were 25 percent below the national average, ranking the state 47th. High tuition revenues (due in large part to high nonresident tuitions) substantially improved this situation, to bring total funding to a level 5 percent below the national average. However, there were substantial sector variations in funding support.

The state appropriated \$15.5 million for student aid, equal to \$5.20 per capita, 24 percent above the national average of \$4.20. Postsecondary vocational-technical institutions received \$6.1 million and state boards and commissions \$2.7 million. Private institutions received no state appropriations for their operations.

#### State Tax Base and Budget

Colorado is a tax-rich state, and had a potential tax capacity in 1981 of \$1,161 per capita, ranking it lith in the nation and 13 percent above the national average of \$1,030. (In 1980, the state ranked 7th, with a capacity 12 percent above average.) This wealth is the result of relatively high tax potentials in general sales (13 percent above average), individual income (15 percent above average), corporate income (17 percent above average), and all categories of property (13 percent above average).

Tax effort in Colorado in 1981, however, was 16 percent below the national average, ranking the state 40th. (In 1980, tax effort was 10 percent below average, with a state rank of 29th). Colorado lost \$125 million by not taxing selective sales at national average rates, and lost \$239 million by its low individual income taxes. However, the state's high level of potential tax wealth offset this lower effort and the state collected revenues that were 6 percent below the national average. Collected tax revenues of \$970 per capita ranked the state 23rd in tax funds available to support public services.

Colorado allocated 10.4 percent of its tax revenues to higher education, equal to the national average. Combined with below-average collected tax revenues, this resulted in appropriations for general institutional support, student aid, and other support of \$101 per capita, 6 percent below the national average.

If the operating budget of the state is taken as a whole (including nontax and federal revenues), higher education received the largest share (29 percent above average), and public welfare received the smallest share (23 percent below average).

#### Higher Education Euroliments

Colorado had 35 residents per 1,000 population attending college somewhere in 1982, almost equal to the national average of 34 per 1,000 population. A large majority, 85 percent, attended public institutions within the state, 7 percent attended independent institutions in state, and 7 percent attended out of state. The national distribution was 73 percent, 18 percent, and 9 percent respectively. Thus, access for the state heavily depends on the public sector.

Colleges and universities in Colorado enrolled 126,814 FTE students in fall 1981, a large higher education enterprise relative to the state's population. The public sector was proportionately larger than the private sector (87 percent

versus 13 percent), as compared to the national average (76 percent versus 24 percent). University enrollment as a share of total public enrollment was proportionately much smaller (8.6 versus 32.1 percent); four-year college enrollment larger (31.0 versus 28.3 percent); and two-year college enrollment much smaller (22.3 versus 37.8 percent).

Colorado had an average number of high school graduates per 1,000 population in 1982 compared to the nation, with 55.9 percent entering state public institutions. This was below the entrance rate nationally of 62.5 percent. In-migration of nonresident students per capita was over twice the national average. Retention of students at public institutions was very high; part-time enrollments were lower than average. Residents made up 46 percent of enrollments at Colorado's independent institutions, below the national level of 60 percent.

#### Institutional Finances and Characteristics

Appropriations to public higher education in Colorado were both low and unevenly distributed relative to national averages The University of Colorado -- Boulder received approprisce is that were 56 percent lower than the national average in research universities without medical programs. This ranked the state last in state support for this type of institution. Appropriations for Colorado State University were 48 percent below average (ranking Colorado last among 17 states in support of a research university with a medical program); the four baccalaureate colleges received appropriations that were 43 percent below average (ranked 37th out of 38 states); the four com, rehensive colleges received appropriations 36 percent below average (ranked 43rd out of 44 states); and the eight academic two-year colleges received average appropriations (index 99). Even with high tuition and other revenues, total funding remained 5 percent below average.

All of the state's public institutions received tuition revenues well above the national average, due in large measure to high nonresident fees and excollments. The two-y-ar academic colleges, with tuition revenues 53 percent above average, were the only type of institutions that achieved above-average total educational and general revenues per student.

Instructional expenditures per student were uniformly below average, with the exception of the two-year academic colleges. Colorado State University, for example, ranks 23rd of 28 states in instructional expenditures per student at research universities with medical programs.

in contrast, the state's 18 independent institutions were well funded in most instances, with expenditures for instruction and academic support per student well above the national average. The University of Denver (university without medical) has above-average tuition revenues and revenues from private gifts and grants, but low endowment income. Instructional expenditures at the state's five independent baccalaureate colleges were 50 percent above average.

#### **Data Notes**

Additional State and Local Government Funding for High.: Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	<b>8</b> 15,551,143
Postsecondary vocational-technical éducation	\$ 6,0°2,290
State boards and commissions	\$ 2,720.373
Retirement benefits (including social accurity)	<b>\$</b> 0
Fringe benafits	<b>6</b> 0
Interstate contracts and reciprocity payments	\$ t82,000
Service functions provided centrally (e.g., computer mervice, library, telephone, etc.)	• 0
Centrally administered capital/debt sarvica	1,394,389
Other	<b>\$</b> •

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Eurrent Funds revenues dedicated to capital purposes:

- tuition and fees - auxiliary enterprises · ather

Tuition and fees reappropriated by the state? no

#### Other Connents

The University of Colorado Health Sciences Center receives indigent patient care appropriations from the state. Therefore state support for general operations for the Health Science Center is over estimated in this report

Required transfers are made from three governing boards to Auraria Higher Education Center.

Source: Colorado Commission on Higher Education

(indexes shown in bold are based on U.S. average = 100)

## CONNECTICUT

#### Recent Trends

In fiscal year 1982, inflation outstripped a small 1.4 percent increase in state funding for public higher education in Connecticut. This created a 6.5 percent drop in the value of state funding per student in constant dollars. Although there was a major increase in tuition revenues (18 6 percent in constant dollars), the decline in state funding still caused a 1.2 percent dip in total operating funds (excluding government grants and contracts). Most types of public institutions were affected, though to different degrees. By contrast, independent institutions experienced a 3.9 percent improvement in purchasing power per student.

State and local appropriations to public higher education in Connecticut increased 28.6 percent between 1978 and 1982, substantially below the national average of 442 nercent However, this low increase was due in part to a decline of ? percent in enrollments. With inflation at 44.3 percent (HEPI), state appropriations per student in constant dollars declined 10.1 percent, compared to the national average loss of 5 3 percent. Tuition revenues increased a substantial 57 percent during the four years, resulting in a 9.7 percent improvement per student is constant dollars, 15th highest in the nation. As a result, total educational and general revenues per student in constant dollars declined only 4.7 percent; the average reduction nationally was 2.3 percent Faculty salaries at public institutions increased 32 percent from 1978 to 1982, substantially less than the CPI inflation rate of 50.2 percent. As a result, faculty experienced a 12 percent loss in their purchasing power.

The 19 independent institutions in Connecticut increased tuition in constant dollars per student by 7.5 percent from 1978 to 1982, substantially above the national average of 2 8 percent. However, revenues from other sources failed to keep pace. As a result, total educational and general revenues in constant dollars per student increased by a more modest 3.4 percent, near the national average. Faculty salaries at independent institutions in Connecticut increased 39 percent during the four years, representing a 7.5 percent decrease in purchasing power.

#### State Financing of Higher Education

Connecticut operates a very small public higher education system, enrolling 21.1 FTE students per 1,000 population in 1982, compared to the national average of 29.2 per 1,000 population. Relative to population, this made Connecticut's public higher education system the 7th smallest in the country. Total per capita appropriations for higher education of \$73 were equally low, with a state rank of 44th. As a result, appropriations per student of \$2,893 were 13 percent below average, ranking the state 37th Revenues from other sources, including tuition, failed to improve total funding relative to national averages.

The state appropriated \$3.5 million for student aid, equal to \$1.10 per capita, far less than the national average of \$4.20. State boards and commissions received \$4.3 million. Independent institutions received some state funding for institutional support.

#### State Tax Base and Budget

Connecticut is a tax-rich state and had a potential tax capacity in 1981 of \$1,132 per capita. This places the state 14th in the nation and 10 percent above the national average of \$1,030. (In 1980, the state had a capacity II percent above average with a rank of 9th.) This wealth is the result of relatively high tax potentials in individual income (43 percent above average) and residential and commercial property (31 percent and 16 percent above average).

Connecticut's tax effort in 1981 was 3 percent above the national average, with a state rank of 17th. (In 1980. Connecticut's tax effort was I perculit below average, with a state rank of 20th.) Connecticut taxes general sales. selective sales, and property heavily but individual income very lightly. Collected tax revenues in 1981 of \$1,163 were 13 percent above average, ranking the state 9th in tax funds available to support public services.

Connecticut allocated 6.3 percent of its tax revenues to higher education, substantially below the 10.5 percent national rate. As a result, state appropriations of \$73.20 per capita for institutional support, student aid, and other support were 32 percent below the national average of \$107.70, with a state rank of 44th,

If the total operating budget of the state (including nontax and federal revenues) is taken into account, elementary/secondary education and public welfare received larger shares of the budget than the national average allocations, and higher education received 39 percent below the national average. Health and hospitals also received a proportionately smaller share.

#### SHigher Education Enrollments

In FY82, Connecticut had 33 residents per 1,000 population attending college somewhere, almost equal to the national average of 34 per 1,000. A very small percentage, 58 percent, attended public institutions within the state; 22 percent attended independent institutions in state, and 19 percent attended out-of-state institutions. The national distribution was 73 percent, 18 percent, and 9 percent respectively. Thus, the state achieves access to higher education through heavy reliance on the private sector and enrollment of residents in other states.

Colleges and universities in Connecticut enrolled III.103 FTE students in fall 1981. The independent sector is proportionately much larger relative to the public sector

than in most states. Enrollment in the universities as a share of total public enrollment was slightly smaller than the national average (28.6 versus 32.1 percent); comprehensive enrollment was above average (35.3 versus 28.3 percent); and two-year college enrollment was about average (35.3 versus 37.8 percent).

In 1982, Connecticut had a large number of high school graduates per 1,000 population compared to the nation, with a below-average 51.6 percent entering state public institutions. The national entrance rate was 62.5 percent. In-migration of nonresident students was 31 percent below the national average. Retention was relatively low; part-time enrollment was slightly above average. Residents made up only 52 percent of the enrollment at Connecticut's independent institutions, below the national average of 60 percent.

#### Institutional Finances and Characteristics

Connecticut's four comprehensive colleges have the state's largest public enrollment and enrolled 23,301 FTE students in fall 1981. Nevertheless, these institutions received the lowest appropriations per student, 36 percent below the national average. This ranked Connecticut last among the 45 states with public comprehensive colleges. Unable to make up this shortfall through other revenues, these institutions spent 36 percent less for instruction per student and 42 percent less for academic support, compared to national averages.

The state's Il two-year academic colleges, which enrolled 16,514 students in fall 1981, fared little better. Appropriations were 26 percent below the national average (ranked 42nd out of 46 states), and expenditures for instruction per student were 41 percent below the national average (ranked last out of 46 states)

A considerably different situation existed at the University of Connecticut, which enrolled 18,877 students in fall 1981. Its appropriations were 23 percent above average for universities without medical programs (ranked 6th out of 28 states). Consequently, expenditures for instruction , or student were at the national average, and academic support was 63 percent above average.

Independent institutions in the state are well funded. Yale University, with tuition revenues 51 percent above average and with over five times the typical endowment income, had 83 percent more funding than research universities without medical programs nationally. The seven comprehensive colleges in the state, enrolling 24,457 students, had nearly average tuition and total funding.

#### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dullar amounts shown on the first data page are shown in per capita terms.)

Student Aid	\$ 3,460,130
Postsscondary vocational-technical education	<b>\$</b> 0
State boards and connissions	8 4,326,435
Retirement benefits (including social security)	<b>\$</b> 0
Fringe benefits	\$ 27,596,113 (estinate)#
Interstate contracts and reciprocity payments	\$ 120,000
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>8</b> 0
Centrally administered capital/dabt service	<b>\$</b> 0
Other	\$ 1,343,245

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences impractices among the states that affect the cumparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

	tuition and fees	8	0
•	auxiliary enterprises		•
•	other		0

Tuition and Fees reappropriated by the state? No answer provided

#### Other Connents

The review of the data by the Board of Govenors revealed that revenues for the public two-year academic/comprehensive institutions are \$173,574 high and for the independent general baccalaureate schools are \$4.9 million low. Riso, the Board eported that the FIE enrollmente reported in this document are higher than their enrollment flywres. Therefore revenues and expenditures per student in this document are slightly less than what the Board reports.

Source: Connecticut Board of Governors for Higher Education

(Indexes shown in bold are based on U.S. average = 100)

322 - 151

^{*} Includes rationent

^{**} The State Comptroller's office, which handles debt service payments on all state general obligation bonds, does not allocate those expanditures according to project or agancy. There is no accurate way to apportion these costs to higher sducation institutions.

### DELAWARE

#### Recent Trends

Delaware was one of 16 states that achieved constant-dollar improvements in state support for higher education in fiscal year 1982. An 11.9 percent increase in appropriations coupled with no growth in enrollment provided a small 1.6 percent net gain. Given that the average state faced a 3.6 percent retrenchment in purchasing power, Delaware's situation was notable. Tuition revenues provided a further 4.3 percent improvement. Overall, the operating base of public institutions showed a net gain of 2.6 percent. In the independent sector the gains were even greater. The total operating base of these institutions improved by 14.6 percent per student.

Delaware's appropriations to public higher education increased 64.4 percent between 1978 and 1982, 8th highest in the nation. Enrollment growth of 9.7 percent was also substantially above average. Given enrollment growth and inflation of 44.3 percent (HEPI), appropriations per student in constant dollars increased 3.8 percent, whereas the national average declined 5.3 percent. Tuition increases at public institutions during the same period failed to keep pace with inflation. This resulted in a 10.1 percent decline in purchasing power, the 8th-largest decline in the country. Thus, total educational and general revenues per student in constant dollars improved by only 2.5 percent during the four years, still better than the U.S. average decline of 2.3 percent Faculty salaries at the state's public institutions increased only 30 percent during the four years; when adjusted for a 50.2 percent increase in the CPI, this represented a 13.5 percent decline in faculty purchasing power.

The three independent institutions in the state improved the real value of tuition per student by 6.1 percent between 1978 and 1982 and substantially increased revenues from other sources. Their total educational and general revenues per student in constant dollars grew a remarkable 18 percent, 4th highest in the nation and 4.8 times the national average. Faculty salaries at independent institutions increased only 35 percent, resulting in a 10 percent loss in faculty purchasing power.

#### State Financing of Higher Education

Delaware operates an exceptionally large public higher education system relative to the state's size. In fall 1981, state institutions enrolled 38.7 FTB students per 1,000 population, compared to the national average of 29.2 per 1.000 population. This made Delaware the 4th-largest system in the country on a relative basis. However, the state's appropriation per capita for higher education of \$112.50 was roughly at the national average. Thus, appropriations of \$2,829 per student were 15 percent below average, ranking the state 39th. To make up the difference.

public institutions in the state received exceptionally high tuition revenues per student. This brought total funding to well above the national average.

In 1982, the state appropriated \$311,000 for student aid. This amounted to \$.50 per capita, compared to the national average of \$4.20. Contracts with independent professional schools in other states equaled \$1.4 million. State funds were not used for the support of independent institutions.

#### State Tax Base and Budget

Delaware is a tax-rich state and had a potential tax capacity of \$1,143 per capita in 1981. In this regard, the state ranked 12th in the nation, Il percent above the national average potential of \$1,030. This wealth was the result of high tax capacity in selective sales (19 percent above the national average), individual and corporate income (18 percent and 44 percent above average), and commercial property (61 percent above average).

Delaware's tax effort, however, was 13 percent below the national average, giving it a state rank of 39th. As a result, collected tax revenues of \$993 per capita provided tax funds slightly below the average amount available to support public services.

Delaware allocated II.3 percent of its tax revenues to higher education, compared to the national rate of 10.5 percent. Combined with slightly below-average tax revenues, this allocation rate resulted in appropriations of \$112.50 per capita for general institutional support, student aid, and other support, slightly above the national average.

If the total operating budget of the state is considered (including nontax and federal revenues), higher education received the largest share relative to national averages (49 percent above average), and elementary/secondary education, public welfare, and health and hospitals received a proportionately smaller share.

#### Higher Education Enrollments

In FY82, Delaware had 30 residents per 1,000 population attending college somewhere, below the national average of 34 per 1,000. Seventy—seven percent attended public institutions within the state; 7 percent attended independent institutions in state; and 16 percent attended institutions out of state. The national distribution was 73 percent, 18 percent, and 9 percent respectively. Although many residents go to other states for higher education, overall access rates fall below national levels due to lower enrollment in the state's public and independent institutions.

The eight colleges and universities in Delaware enrolled 25,505 FTE students in fall 1981, making the state's public and independent systems extremely small relative to the

state's population. The state's five public institutions enrolled 23,057 students, making the public sector proportionately large compared to the private sector (90 percent versus 10 percent). The proportion at the national level was 76 percent versus 24 percent. University enrollment, as a share of total public enrollment, was proportionately much larger than the national average (68.2 versus 32.1 percent) as was baccalaureate enrollment (8.0 versus 3.9 percent); two-y-ar college enrollment was smaller (23.8 versus 37.8 percent).

In 1982, Delaware had a large number of high school graduates per 1,000 population compared to the nation, but only 47.8 percent entered state public institutions. This fell far below the national entrance rate of 62.5 percent. In-migration of nonresident students was 4.8 times the national average. Retention was near the national average, and part-time enrollments were below average. In the independent sector, residents made up 47 percent of enrollment, whereas the national proportion was 60 percent.

#### Institutional Finances and Characteristics

Delaware has an inconsistent pattern of state support for its public institutions. In 1982, appropriations per student for the largest sector, the University of Delaware, were 16 percent below the national average for nonmedical universities (ranking 2'1st out of 2.8 states). In sharp contrast, appropriations to Delaware State College were 68 percent above average for baccalaureate colleges (ranking 3rd out of 38 states). Appropriations to the state's three two-year occupational colleges exceeded the national average by 12 percent.

In a remarkable financing effort, the University of Delaware made up its shortfall in appropriations by securing tuition revenues 77 percent above the national average. Private gifts, grants, and endowments were five and a half times the average, and revenues from other sources were three times the average. The university was thus able to fund instruction per student at 52 percent above average (ranking 3rd out of 28 states) and to provide public services at 15 times the national average rate.

Delaware State College, with total educational and general revenues 53 percent above average, funded instruction per student only 9 percent above average. The emphasis at this institution is on research and public service.

The state's three independent institutions had small enrollments. The general baccalaureate institution was adequately funded, as was the two-year occupational college. The specialized professional college was substantially underfunded compared to national averages.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the MEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$ 311,185
Poeteecondary vecational-technical education	<b>\$</b> 0
State boarde and commissions	\$ 75,800
Retirement benefite (including social security)	<b>\$</b> •
fringe benefite	<b>\$</b> 0
Interstate contracte and reciprocity payments	<b>\$</b> 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>\$</b> •
Centrally administered capital/debt eervice	<b>\$</b> 0
Other (contracte with independent prefeesional echapis in other states)	\$ 1,444,500

#### Clarification of Institutional Financial Reporting

These funde have meen included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ \$.127,500 appropriations to public institutions in the state

A Tuition and feee are reappropriated for Delaware Technical and Community Colleges; tuition and fees are not reappropriated for Delaware State College and University of Delaware.

## DISTRICT OF COLUMBIA

#### Recent Trends

The District of Columbia's higher education system is almost entirely independent in character. Only 12 percent of the District's students enrolled in its single public institution. In 1982, the University of the District of Columbia (UDC), a comprehensive institution, received \$53.0 million in local support. Appropriations to UDC increased 25.0 percent from 1978 to 1982, far below the national average of 44.2 percent. This low increase was due partly to the high level of existing funding and partly to an 11.0 percent decline in enrollments. When inflation is taken into account, appropriations per student in constant dollars declined 2.5 percent. This decline was offset by a substantial 65 percent increase in tuition during the four years, which increased tuition revenues per student by 28.8 percent in constant dollars, 4th highest in the nation. As a result, total educational and general revenues per student in constant dollars increased 2.9 percent; the nation experienced an average 2.3 percent decline. Faculty salaries at UDC increased only 25 percent during the four years, with a loss in purchasing power of 17 percent.

The District's II independent institutions, which enrolled 54,618 students in fall 1981, increased tuition between 1978 and 1982 to more than match inflation. This represented an 8.6 percent improvement in constant dollars per student. Increases in revenues from other sources were not as great. As a result, total educational and general revenues per student increased 5.7 percent, still well above the national average of 3.7 percent. Faculty salaries at independent institutions declined 9.5 percent in constant dollars from 1978 to 1982.

#### State Financing of Higher Education

The District of Columbia operates the smallest public higher education system in the United States, enrolling 12.0 FTB students per 1,000 population compared to the national average of 29.2 per 1,000 population. However, total per capita appropriations for higher education of \$98.30 were only 9 percent below average. Relative to enrollment, appropriations per student were \$6,954, twice the national rate, ranking the District 2nd in the nation. Revenues from other sources were low. Nevertheless, total support per student remained 61 percent above average.

The District appropriated \$559,000 for student aid, equal to \$90 per capita, far below the national average of \$4.20. The District appropriated a sizable \$8.1 million to provide centrally located service functions such as computer and library services. Independent institutions in the District received \$1.10 per capita in government support.

#### State Tax Base and Budget

The District of Columbia is tax rich and had a potential tax capacity of \$1,143 per capita in 1981. In this regard it ranked 13th in the nation, il percent above the national average of \$1,030. This was the result of high tax potential for selective sales (30 percent above average) and individual income (35 percent above average).

The District's tax effort was also high, 46 percent above the national average, ranking it 3rd in the nation. It secured \$149 million in additional revenues by taxing individual income at 89 percent above the national rate. As a result, the District collected tax revenues of \$1,663 per capita. This amount was 61 percent above average, ranking the District 2nd in tax funds available to support public services.

The District allocated 5.9 percent of its tax revenues to higher education, substantially below the 10.5 percent national rate. But due to high revenues, appropriations of \$98.30 per capita for institutional support, student aid, and other support were only 9 percent less than the national average.

If the operating budget of the District is taken as a whole (including nontax and federal revenues), public welfare receives a larger share of the budget relative to national average allocations, and higher education, elementary/secondary education, and highways receive proportionately smaller shares.

#### Higher Education Barollmonts

In FY82, the District of Columbia had 29 residents per 1,000 population attending college somewhere, below the national average of 34 per 1,000 population. A very small proportion, 38 percent, attended public institutions within the District; 45 percent attended independent institutions in the District; and 17 percent attended institutions out of state. The national distribution was 73 percent, 18 percent, and 9 percent respectively.

The 12 colleges and universities in the District enrolled 62,243 FTE students in fall 1981, making it the smallest public system and the largest independent system in the nation relative to population. The independent sector is proportionately much larger relative to the public sector than in most states (88 percent versus 12 percent).

In 1982, the District of Columbia had a small number of high school graduates per 1,000 population compared to the nation, with an above-average 70.2 percent entering the University of the District of Columbia. The national entrance rate to state public institutions was 62.5 percent. In-migration of nonresident students was very low. Retention was also very low, and part-time enrollment was above average. In the independent sector, residents made up an extremely small 12 percent of total unrollments; the national proportion was 60 percent.

#### Institutional Finances and Characteristics

The University of the District of Columbia received appropriations per student of \$6,954, 2.2 times the national average for comprehensive colleges (ranking 2nd out of 45 states). With this support, tuition revenues per student were substantially below average. Revenues from other sources were high. As a result, total educational and general receives per student (excluding government grants and contracts) totaled \$7,904, 2nd highest in the nation for comprehensive colleges.

Because of this exceptional funding, instruction and academic-support expenditures were substantially above average, as was spending for public service. Research expenditures per faculty member, however, were only one-third the national average.

The District has six major independent institutions. The three universities with medical programs—George Washington University, Georgetown University, and Howard University—have above—average funding and above—average expenditures for instruction and academic support. American University and Çatholic University of America, the nonmedical universities, have similar above—average funding. These institutions also have high expenditures for instruction and academic support because of their emphasis on these functions. To conduct its specialized educational mission for the deaf, Gallaudet College, through federal support, was funded in 1982 at 5.3 times the average for a comprehensive institution. The independent institutions had public—service expenditures per capita that average 21 times the national rate.

(Indexes shown in bold are based on U.S. average = 100)

A Prior to 1981 tuition was treated as revenue to the General Fund. Since 1981, tuition revenue is treated as a credit to the University fund and reported as tuition.

### **FLORIDA**

#### Recent Trends

Florida continued its profile of small but real-dollar gains in both state funding and overall revenues in constant-dollar funds per student in fiscal years 1982, 1981, and 1980. Florida was one of 16 states that experienced any improvement in state and total funding in fiscal year 1982, after adjustment for inflation and enrollment changes. All sectors except the academic/compichensive two-year schools participated in the gains. Interestingly, these gains in total funding were achieved despite general losses in the value of tuition funds collected.

The cumulative gain in funding in Florida's public sector between 1978 and 1982 created a 5.4 percent improvement in its overall revenue base. Florida ranked 10th in the nation in its gain in adjusted-dollar general operating funds for the public sector. Increases of 63.3 percent in state and local funds for higher education in Florida were able to accommodate both the 7.0 percent increase in enrollments and the 108 percent loss in the value of per-student tuition revenues. The net result was a 5.4 percent real-dollar gain. in revenues per student. These gains were above 15 percent in three sectors universities with medical (University of South Florida), comprehensive institutions, and the two-year occupational institution (South Florida Junior College) At the medical research university (University of Florida) and the nonmedical university (Florida State liniversity), real-dollar revenue gains of 4.4 percent were achieved. By contrast, the two-year academic/comprehensive institutions had a loss of 19 percent in the value of their funds

Florida's independent institutions continued to see funding support eroded by inflation and enrollment growth Between 1978 and 1982, revenues per student adjusted for inflation dropped 3-8 percent. Only the two-year academic schools and the professional/specialized schools had real-dollar gains.

#### State Financing of Higher Education

Florida ranks 40th in the nation in per capita support of higher education, spending \$85 per person, a level 21 percent below average. As in most states, almost all state finding is directed to the public sector, in Florida, 98 percent of all support goes to aid either students or institutions in the public sector. Florida does, however, provide both student aid and institutional appropriations to the independent sector, but at below-average rates. This is not surprising given that Florida's resident enrollment in the independent sector is less than average.

#### State Tax Buse and Budget

Florida has average resources to support public functions, ranking 20th nationally in tax capacity. The state's tax capacity is due to high levels of general and selective sales, residential property, and death and gift transfers, which together counterbalance the low capacity in other areas. However, except for selective sales, Florida has below-average tax rates in each of those categories. This low tax effort results in tax revenues one-quarter below typical levels, and it largely explains why, despite average tax capacity, Florida's tax revenues are so low.

That also explains why Florida's support to higher education ranks so low nationally—although the share of tax revenues devoted to higher education is somewhat below average, the small size of the tax pool is largely responsible for the below—average level of support.

Census Bureau data indicate that Florida's budget strongly emphasizes expenditures for health and hospitals and public services, though the share of the state budget allocated to them fell between 1978 and 1982. Shares for elementary/secondary education, highways, and other functions are close to average, while welfare receives approximately 40 percent less than the typical share of the budget. Since the size of the stave budget in Florida is smaller than usual, functions receiving lesser shares are doubly impacted.

#### Higher Education Eurollments

Florida ranks last in the nation in terms of the number of residents who enroll in higher education, 28 percent below average. Enrollment of residents is below national rates at both in-state and out-of-state institutions.

Because the number of entering high school graduates in Florida is 26 percent below the US average, the first-time enrollment level of residents is 25 percent below typical levels. However, strong enrollment by nonresidents and above-average retention of students in the system counterbalance these factors to some degree. Still, enrollment in the public sector is 23 percent below national levels. Florida enrolls 22.6 FTE students per 1,000 population compared to 23 2 FTE per 1,000 in typical states.

There is an unusually large concentration of students in the public community colleges in Florida, representing 57 nercent of enrollments, in contrast, two-year students make up 38 percent of the total in most other systems. As a result, enrollments in both the university sectors and in the comprehensive institutions are smaller than usual.

#### Institutional Finances and Characteristics

Although Florida's support of higher education is comparatively low, the state's system, with its major emphasis on two-year institutions, is relatively less expensive to support. In addition, the system's focus of graduate studies is lower than average, and schools are generally larger than average. This further reduces the financial load on the state and creates a system of higher education that is comparatively less expensive to operate.

State appropriations per student are 9 percent above national norms generally, a profile that is repeated in every sector except the two-year academic/comprehensive institutions. At the University of Florida, the public research university in the state (with a medical program), state funding is 47 percent above the average for similar institutions. While below-average tuition revenues reduce this margin, the University of Florida still operates with total revenues per student (excluding government grants and contracts) that are 23 percent above average. The University of South Florida receives state funding per student about 31 percent above average. And despite lower revenues from other sources, this institution's operating base is still 4 percent above average. Florida State University is relatively well funded by the state, receiving 33 percent more funds than average. However, despite other revenues that are below average, its total base is still slightly better than the national pattern of similar schools (index 103). The public comprehensive institutions receive 54 percent more in state funding than average, and when other revenues are factored in, the sector functions with 38 percent more funding than average.

The two-year comprehensive/academic institutions, the largest single sector in the state, receive state appropriations that are slightly below the average for such schools (by 2 percent). This shortfall is ameliorated by revenues from other sources, and the sector as a whole operates with per-student funds that are 4 percent above average. In contrast, the independent institutions are funded at levels 20 to 40 percent below average, except for the two-year schools and the health-professional institution.

Faculty salaries in Florida overall are 10 percent below average in both the public and independent sectors. However, this overall profile varies by institutional type. The universities and comprehensive institutions pay at rates close to the average. In the two-year sector, however, average salaries are 10 to 23 percent below those paid at similar institutions. Between 1978 and 1982, salaries at the universities and comprehensive institutions markedly improved, at rates generally 10 to 20 percent better than average. In sharp contrast, salaries in the large comprehensive two-year sector increased by about 40 percent less than salaries at other community colleges in the nation.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the MEGIS institutional finance rep: t are shown here. The amounts shown below are included in the State and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$ 18,159,000
Postse Ondary vocational-technical education	\$ U
State boards and commissions	\$ 7,033,338
Retirement benefits (including social security)	\$ 0
Fringe benefits	<b>\$</b> 0
Interstate contracts and reciprocity payments	<b>\$</b> 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	\$ 5,518,483
Centrally administered capital/debt service	<b>\$</b> 0
Other	• 0

Clarit Lation of Institutional Financial Reporting

These funds have been included in the HEVIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state  $\sigma$  -local \$ 0 appropriations to public institutions in the state

Eurrent Funds revenues dedicated to capital purposes:

- tuition and fees \$ 5.577,930 - auxiliary enterprises \$ 0 - other \$ 0
- Tuition and fees reappropriated by the state? No

### **GEORGIA**

#### Recent Trands

Georgia's public system of higher education lost ground in fiscal year 1982, with neither state and local appropriations nor tuition keeping pace with inflation and enrollment shifts. The constant-dollar value of funding fell 8 percent per student in this state. Still, the purchasing losses in Georgia were less severe than those experienced generally in the states. Nationally, constant-dollar funding for higher education fell 2.0 percent, and 3.4 states had some loss in purchasing power per student. The slippage in Georgia in 1982 was a repeat of that which occurred in 1981 Still, the four-year profile for the state is positive

Between 1978 and 1982, state appropriations in Georgia increased 52.2 percent, a rate 41 percent above average Because enrollment gaths were lower than average, the net effect of this increase, ever after adjustment for inflation, was a 9.5 percent improvement in state support of public higher education. Only six other states fared better in this regard than Georgia. Given that the national average was a 5 3 percent loss in constant-dollar state support per student, Georgia's gain of 9.5 percent is even more Impressive

Increases in tuition revenues did not move in step with inflation (slipping 40 percent), thereby eroding some of the gains in state support. Nevertheless, the operating base for the public sector made real-dollar improvements of 7.3 percent between 1978 and 1982. All public institutional sectors shared in these funding gains, except the University of Georgia (research university with medical), where real-dollar funding per student fell 2 6 percent between 1978 and 1982

#### State Financing of Higher Education

... ugh Georgia channels a relatively large share of state ta. venues to higher education, the small size of the total state budget causes funding of higher education to be 6 percent below average. Georgia provides \$102 per capita in support of higher education, ranking 27th in the nation Therefore, despite recent funding increases, Georgia's relative position among the states changed only marginally

The bulk of state funding goes to the public sector. Eighty percent of state funds for higher education are allocated to institutional support, I percent to student aid, and a relatively large share, 19 percent, for indirect support (primarily for vocational education and separately funded cetirement benefits). As a result of the exclusion of the vocational softer from the remaining analysis, enrollments and funding are underestimated in the ensuing sections of this report on Georgia

#### State Tax Base and Budget

Georgia is a state with very low inherent tax capacity, and the problem of raising revenues is somewhat exacerbated by a tax effort that is 3 percent below average. In fact, Georgia's capacity to tax is below average in all categories Further, the state underutilizes its capacity in almost every category, exceptions are general and selective sales and individual income. As a consequence, state tax revenues are approximately one-fifth lower than average. Only 12 other states operate with less revenue per capita.

Georgia provides above-average budget shares to health and hospitals and highways. All other state functions are below average, particularly higher education, public welfare, and public services. The higher education share of the budget is 14 percent below average and slipped between 1978 and 1982, falling from 8.7 percent to 8.2 percent of the state's

#### **Higher Education Enrollments**

Georgia residents (along with those in Florida) have the lowest rates of access in the country. (Inly 24 per 1,000 population enroll in higher education compared with a US average of 34 per 1,000. In other words, residents of this state are one-fourth less likely to pursue higher education However, because enrollments in the vocational-technical sector are not included in these figures, this low access rate is inconclusive. Inclusion of the vocational-technical sector would raise Georgia's access rates to 28 per 1,000, a level that is still far short of national rates. The low access rates are evident in every enrollment category, both inside and outside the state.

Enrollments are heavily concentrated within the three universities in the state (including Georgia Tech), which account for over 40 percent of the total. This is an unusually large share, and this type of education is more expensive to support. Associated with this heavy university emphasis, the state's share of graduate enrollments is 38 percent la ger than usual. These two circumstances combined to create a further financial load on the state.

#### Institutional Finances and Characteristics

Because FTE earollment per 1,000 population is below average in the public sector, Georgia's lower level of state funding overall is more than counterbalanced. Per-student revenues in the public sector are 7 percent above average, and state responder per student are 16 percent above average. However, sixte and total funding per student varies considerably among the different sectors

The University of Georgia is above average in state funding (by 21 percent) and close to the average in total E&G revenues, on a per-student basis. The public baccalaureates are funded by the state at above-average rates (index 144). Georgia Institute of Technology receives an average level of state funding but, with revenues from other sources. functions with 11 percent more funding than other research universities (without medical programs). However, every other public sector functions with funds that are between 1 and 53 percent below average.

Faculty galaries in Georgia are generally below average for all ranks, though there have been substantial gains. There are significant variations among the different types of institutions. For instance, saiaries at the universities, with the exception of Georgia Institute of Technology, are funded at or above the average for upper-rank faculty. At other types of public institutions (except the baccalaureates), salaries are generally 7 to 16 percent below average for the same faculty rank. These conditions exist despite recent salary increases at these schools, which exceeded national patterns by 32 percent.

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	\$ 5.310,245
Postsecondary vocational-technical education	\$ 59,461,524 (24,825 FTE)*
State boards and commissions	\$ 3,336,680
Retirement benefits (including social security)	\$ 43,965,141
fringe benefits	• •
Interstate contracts and reciprocity payments	\$ 487,000
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>\$</b> 0
Centrally administered capital/debt service	<b>6</b> 0
Other	<b>6</b> 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences ampractices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 18.099.000^{AA} appropriations to public institutions in the state

Eurrent Funds revenues dedicated to capital purposes:

### **HAWAII**

#### Recent Trends

Fiscal year 1982 was one of some marginal improvement in revenues for Hawaii's public higher education. After adjustment for inflation and enrollment growth, total revenues per student (excluding grants and contracts) gained 1.3 percent, fueled primarily by a 3.7 percent real-dollar gain per student in state and local appropriations. These gains meant that Hawaii was among the 16 states nationally that received some increase in support. In fact, Hawaii ranked 6th nationally in real-dollar gains in state and local appropriations and 15th in overall revenues improvement. The 6.1 percent drop in the value of tuition revenues therefore was more than counterbalanced by gains in state support. Appropriations to public institutions in Hawaii in absolute terms increased by 49.1 percent between 1978 and 1982, exceeding national rates of growth by 11 percent. Furthermore, with a 9 percent drop in enrollments, the value of these state montes moved upward by 4.3 percent per student, even after adjustment for inflation. This real-dollar increase in state funding placed Hawaii 18th among the states and, despite a decline of 20.8 percent in the inflation adjusted value of tuition revenues, produced a 1.5 percent overall increase in E&G funding per student. Funding gains were achieved by the University of Hawaii -- Manoa (research university with medical) as well as by the two-year academic and comprehensive sector, 3.2 and 10.6 percent respectively. By contrast, the two general baccalaureate campuses and the two occupational two-year campuses had respective losses in overall purchasing power of .6 percent and 3.5 percent.

The gains in funding for the independent sector were far larger, increasing from 1978 to 1982 by 52.3 percent in real dollars per student. However, the gains by sector were uneven; the baccalaureate schools doubled their operating budgets while the budgets of the specialized schools dropped 5.1 percent.

#### State Financing of Higher Education

In FY1982, Hawaiians supported higher education at a rate 51 percent above the national average. State and local government provided \$163 per capita to public colleges and universities, placing Hawaii 3rd in the nation in its support of higher education (following Alaska and Arizona). There are no state-supported student-aid programs; all state support is funneled either directly to the public institutions or through separate arrangements that cover centrally provided services, the system's administration, or interstate contracts and reciprocity payments.

#### State Tax Base and Budget

Hawaii has an above-average tax capacity, ranking 17th nationally. In addition, the rate of taxation in the state is 26 percent above average. Only five other states are more willing to tax: Alaska, New York, the District of Columbia, Massachusetts, and Rhode Island. As a result, Hawaii raises 31 percent more tax revenues per capita than average, raising \$1,353 per person in 1982.

The state's tax structure emphasizes sales and income tax categories, and more than 80 percent of all tax revenues are collected in these particular areas. Property taxes are a fairly minor source of Hawaii's tax revenues. Hawaii ranks 4th in the nation in potential in this category, but only 46th in efforts to utilize this source.

Census data (which include both tax revenues and federal revenue-sharing funds) established a budget of \$2,336 per capita for the state in FY1982, a level 22 percent above average. Although the largest single share of taxes, 17.8 percent, is budgeted for elementary/secondary education, this share is 32 percent below average. Public welfare is next in size, garnering 12.9 percent of state expenditures, followed by public services at 12.7 percent and higher education at 10.8 percent -- all shares that are average or above average. Highways and health and hospitals receive a smaller than usual slice of the state budget, 6.3 and 6.9 percent respectively -- shares that are 20 percent and 25 percent smaller than is typical. Still, because there is a larger than average state pie for public programs, the actual dollars involved are more than might be expected. Therefore, higher education is doubly benefited in its receipt of an above-average portion of the budget. However, census figures indicate that between 1978 and 1982 higher education's potion of the budget shrank from 11.3 percent to 10.8 percent.

#### Higher Education [ wrollments

Residents of Hawaii pa...icipate in higher education at rates somewhat better than the national average, with 36 FTE of each 1,000 Hawaiians enrolled in college. The majority of these students attend public in-state institutions, although large numbers of residents also go out of state for higher education. Only a small fraction enrolls in the state's independent institutions. Hawaii is among the top third of states in college participation by state residents.

Hawaii's higher education system is almost entirely public (ranked 8th in the nation), and 94 percent of its students are in public institutions. Half of the public students are enrolled at the Manoa campus of the University of Hawaii.

The state's other large sector is made up of its two-year institutions, which enroll 41 percent of the students. Only 9 percent of students are enrolled in public baccalaureate institutions, and there are no comprehensive institutions in Hawaii. This concentration of students in the university sector creates a system of higher education that is, on average, more expensive to support. However, the graduate emphasis of the university is less than typical, with the result that, overall, graduate education in the state is only slightly greater than average.

#### Institutional Finances and Characteristics

Hawaii is generous in its support of higher education, and per-student appropriations are 31 percent above average. However, because revenues from tuition (in particular) and other sources are substantially below average, the net result is that per-student support in the public sector is only slightly better than the national average. However, relative funding rates vary by sector. The two-year occupational schools are most severely impacted, functioning with revenues that are one-third below average. The Manoa campus also is strongly affected; overall E&G revenues are 14 percent below average. The public baccalaureate schools have per-student revenues that are 4 percent above average, and revenues of the academic/comprehensive two-year schools are just 1 percent below average.

Since state funding is substantial and residents are already highly taxed, the major source of additional revenue would appear to be tuition. Tuition revenues in Hawaii are approximately half those collected elses here. And in the two-year sector, such revenues are 75 to 78 percent below average. Although low tuition rates encourage access, their continuation poses important policy decisions for the state and its institutions, given the probable impact of relatively low operating revenues.

The effect of below-average funding in Hawaii's public system is less apparent in faculty salaries, which are equivalent to national averages. However, from 1978 to 1982, when faculty salaries nationally were increasing by 36 percent, the gain in Hawaii was 24 percent. Salaries at the independent institutions also grew at rates substantially below average (17 percent in Hawaii, compared to a national average of 36 percent).

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through he HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	8	0
Postsecondary vocational-technical education		0
State boarde and COMMITMETONE		5,853,058
Retirement benefite (including social security)	6	
Fringe benefite		0
Interetate contracts and reciprocity payments		840.886
Service functions provided centrally (e.g., computer service, library, telephone, etc.)		2,595,151
Centrally administered capital/debt service		0
Other		0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences impractices among the etates that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

Tuition and fees reappropriated by the state? No

### **IDAHO**

#### Recent Trends

Idaho increased appropriations to public higher education by only 19.2 percent between 1978 and 1982. During this same period, enrollments grew at the national rate of 5.6 percent. With inflation during the four years equaling 44.3 percent (HEPI), appropriations per student in constant dollars declined 21.8 percent, 3rd worst in the country. The national average was a 5.3 percent reduction. Institutions attempted to make up the difference by more than doubling tuition revenues, resulting in a 42.0 percent increase per student in constant dollars. However, there remained a 7.6 percent loss in total educational and general revenues per student in constant dollars. During these four years, faculty salaries at public institutions increased 33 percent. However, when salaries are adjusted for a 50.2 percent increase in the CPI during this period, faculty lost 11.5 percent of their purchasing power.

Funding improvements were substantial in the private sector during the same four-year period. The three independent institutions increased tuition revenues per student by an average of 16.4 precent in constant dollars. Total educational and general evenues per student in constant dollars increased 14.9 percent. By comparison, the national average increase for independent institutions was 3.7 percent.

#### State Financing of Higher Education

Relative to its population, Idaho operates a slightly smaller than average public higher education system; in 1982, it enrolled 27.1 FTE students per 1.000 population, compared to the national average of 29.2 per 1,000 population. Total per capita appropriations for higher education of \$98.60 were 8 percent less than the national average. As a result, appropriations per student of \$3,547 were 7 percent above the national average, ranking the state 19th. Except for tuition, revenues from other sources were high, bringing total funding to Il percent above the national average Idaho's funding profile is impressive, given the repeated retrenchments in recent years and inflation.

The state appropriated \$264,000 for student financial aid. Postsecondary vocational-technical institutes, enrolling 330 FTE students, received \$1.2 million. State boards and commissions received \$337,000. State funds were not used to support independent institutions.

#### State Tax Base and Budget

With a tax capacity of \$891 per capita in 1981, Idaho fell below the national average of \$1,030 by 13 percent, ranking the state 38th nationally. This low capacity was due, in part, to low tax potential in individual income (32 percent below the national average) and corporate income (28 percent below average).

Idaho's tax effort was also 13 percent below the national average, with a state rank of 36th. Idaho lost \$68 million in property taxes by not taxing at national average rates, and \$84 million because of below-average tax rates on general sales. As a result of low capacity and effort, collected tax revenues of \$775 per capita were 25 percent below average, ranking Idaho 41st in tax funds available to support public services.

Idaho allocated 12.7 percent of its tax revenues to higher education, substantially above the 10.5 percent national rate. As a result, even with low collected tax revenues, appropriations of \$98.60 per capita for institutional support, student aid, and other support approached the national average of \$107.70.

If the total operating and capital budget of Id-ho (including nontax and federal revalues) is considered higher education and highways received a larger share of the budget relative to national average allocations; public welfare received a relatively smaller share.

#### Higher Education Enrellments

In FY82, Idaho had 28 residents per 1,000 population attending college somewhere, a rate 16 percent below the national average of 34 residents per 1,000 population. A large proportion, 79 percent, attended public institutions within the state; Il percent attended independent institutions in state; and Il percent attended institutions out of state. The national distribution was 73 percent, 18 percent, and 9 percent respectively. Below-average access was tied to lower rates of attendance at both public and private institutions in the state.

The nine colleges and universities of Idaho enrolled 33,573 FTE students in fall 1981. The public system, consisting of six institutions enrolling 26,110, had 78 percent of the students, making it an average-size public system relative to the state's population. University enrollment, as a share of the public total, was much larger than the national mix (50.0 versus 32.1 percent); comprehensive and general baccalaureate enrollments were also much larger (36.2 versus 28.3 percent); and two-year college enrollment was much smaller (13.8 versus 37.8 percent). The three independent institutions in Idaho enrolled 7,463 FTE students in fall 1981, a slightly smaller private enterprise than average, relative to population.

In 1982, Idaho had an average number of high school graduates per 1,000 population compared to the nation, but only 43.6 percent entered state public institutions, well below the national rate of 62.5 percent. In-migration of nonresidents was 1.7 times the national average. Retention was 7 percent above the national average, and full-time enrollments were also above average. Residents made up 35 percent of enrollment at Idaho's independent institutions. far below the national proportion of 60 percent.

#### Institutional Finances and Characteristics

The University of Idaho, which enrolled 7,560 students, received appropriations per student that were 51 percent above average for universities without medical programs. The comprehensive institutions received appropriations 2 percent below average. Tuition revenues per student at these institutions were low (27 percent below average for the nonmedical university, and 18 percent below average for the comprehensives). Total educational and general revenues per student were 64 percent above average for the nonmedical universities, and 1 percent above average for the comprehensives. Expenditure patterns were similar, with instructional expenditures per student at the university 16 percent above average and at the comprehensives only 3 percent above average. The two two-year academic colleges were extremely well funded, receiving appropriations ranking 8th in the nation.

Idaho's two independent general baccalaureate colleges received below-average tuition revenues and secured total educational and general revenues (excluding government contracts) per student of 14 percent below average. Consequently, expenditures for instruction and academic support were substantially below average. Ricks College, a two-year academic institution enrolling 5,611 FTB students, made up for its low tuition with high funding from private gifts and grants. Ricks College spent Il percent more for instruction and 66 percent more for academic support than the national average.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Ald	\$ 263,900
Posteecondary vocational-technical aducation	\$ 1,20\$,200 (330 FTE)
State boards and commissions	\$ 337,200
Retirement benefits (including social security)	<b>8</b> 0
Fringe benefite	8 421,600
Interetate contracts and reciprocity Payments	8 *
Service functions provided centrally (e.g., computer service, library, telaphone, etc.)	<b>8</b> 0
Centrally administered capital/debt service	<b>6</b> 0
Other	<b>6</b> 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funda revenues dedicated to capital purposes:

- tuition and fees \$ 0 - puxiliary enterprises \$ 0 - other

Tuition and Fees reappropriated by the state? No

#### Other Connents

Funding for WICHE Student Exchange Program, the University of Utah Hedical School contract, the Creighton Dental School program, and the Femily Practice Residency Program is appropriated directly to the State Board of Education and, therefore, is not included in HEGIS.

### **ILLINOIS**

#### Recent Trends

Illinois experienced major erosion in its real-dollar funding in fiscal year 1982. The public sector sustained a 7.9 percent drop in overall revenues, adjusted for inflation and erollment shifts, a decrease exceeded in only ten other states. The loss was due primarily to the 10.0 percent decline in the value of state and local appropriations, and a 3.4 percent constant-dollar decrease in tuition revenues per student further exacerbated these circumstances. All public sectors except the health-professional sector (University of Illinois Medical Center--Chicago) found their real-dollar funding slipping in fiscal year 1982.

In Illinois, state and local appropriations to higher education increased at slower rates between 1978 and 1982 than was typical and at rates that were surpassed by inflation and enrollment growth. The \$992 million appropriation for public institutions in 1982 represented a 376 percent increase from 1978, but it was still 15 percent lower than the 44.2 percent jump that occurred nationally. In fact, only 17 states had smaller gains in state funding. Compounding the situation, during this same period enrollments in the Illinois public sector increased by 4.8 percent. In the face of inflation and enrollment gains, the value of state monies in constant dollars per student dropped 8.9 percent.

All sectors of Illinois public higher education except the comprehensives experienced funding losses over this four-year time span. While the comprehensives had small gains of 2.3 percent in their real funding, other sectors had losses running from 6.4 percent to 2.6.5 percent. The two-year occupational schools were affected most, as they found their purchasing power plummeting by 2.6.5 percent. These losses were primarily due to the failure of state appropriations to keep pace with inflation and excollment, though fuition revenues were lagging as well.

Fueled by real-dollar gains in tuition revenues, the independent sector in Illinois gained 3.5 percent in its total E&G revenues per student, even after adjustment for inflation. Only the two-year occupational sector suffered any major loss in the total purchasing power of its funds. (There was a smaller decline of 3.8 percent in the private baccalaureate sector.) Although the loss for the two-year occupational sector was substantial, 45.7 percent, other private sectors gained as much as 29.1 percent.

#### State Financing of Higher Education

In 1982, Illinois spent \$100 per capita to finance higher education. This level of support was 8 percent below average and was due to the relatively low share of tax revenues (15 percent below average) being channeled to higher education.

The state is diverse in its methods of supporting higher education, funding public and private institutions directly and providing student aid in both sectors. The state is above average in the extent to which it supports independent 200

students and institutions, as well as in the amount of student aid it provides students attending public institutions in the state. By contrast, state appropriations in the form of public general institutional support are below average by 11 percent.

Illinois spends 8 percent of its higher education budget for student aid, a share that is more than twice the national average (index 202). The state also funnels 6 percent of its funds to the independent sector, again a share that is nearly twice the average. As a result, the share accorded to public institutions is somewhat reduced. The \$87 per capita that these institutions receive represents 87 percent of all higher education dollars in the state (compared to 90 percent nationally).

#### State Tax Base and Badget

Illinois ranks 18th in the nation in its inherent tax wealth and it has a tax capacity that is 4 percent above average. Above—average tax capacity and tax rates in Illinois placed the state 12th nationally in tax revenues collected per capita. Collecting \$1,124 per person in 1981, the state functioned with 9 percent more in tax revenues than average.

The state's use of these funds shows an above-average emphasis on public welfare and public services (indexed at 120 and 118 respectively). On the other hand, relative shares of funding are 5 percent below average for higher education, 27 percent below average for health and hospitals, and 2 percent below average for elementary/secondary education. From 1978 to 1982, higher education's share of the state's budget was relatively stable (at approximately 9 percent).

#### Higher Education Enrellments

Illinois residents rank 11th in the nation in their rates of access to higher education, primarily because of above-average enrollment in the state's private colleges and universities. Residents of the state are 9 percent more likely to enroll in higher education than is average.

Total enrollment (residents and nonresidents) in the state's public institutions is about 4 percent below average Approximately 28 FTE students per 1,000 capita are in public institutions, compared with the U.S. average of 29 per 1,000. The initial rate of attendance by residents is 41 percent above average, but a low retention rate, a tendency toward more part-time study, and very low in-migration from other states reduce this initially large enrollment level. On the other hand, the independent sector in Illinois, because of the extensive enrollment of state residents, is 11 percent larger than usual.

The Illinois system of public higher education places a much greater emphasis on two-year education than do most state systems. Half of the public students attend these two-year schools, whereas the U.S. average is 38 percent.

#### Institutional Finances and Characteristics

Illinois provides 11 percent less than average in per capita state appropriations to its public institutions, and these institutions as a group enroll 4 percent fewer students than is generally the case. Given a relatively lower base of state funding compared to the number of students it supports. state appropriations at \$3,080 per stud nt are 7 percent below the U.S. average. However, state funding varies considerably by sector. In 1982, the Urbana campus of the University of Illinois (research university with medical) received state funding that was 7 percent above average. Southern Illinois -- Carbondale (university with medical) is funded at 9 percent above average, and the 7 comprehensive institutions receive 15 percent more than the average. The universities without medical program: receive state funds per student that are 7 percent below average. The 45 academic/comprehensive two-year schools, the 5 occupational two-year schools, and the public health-professional institution are the lowest in relative funding, receiving state dollars at rates 12 to 33 percent below average. Higher tuition revenues in the academic/comprehensive two-year sector help to offset this lower level of state funding. Still, the largest sector in the state, the two-year academic sector, operates with a total level of E&G funds that is 13 percent below average.

In general, tuition revenues in Illinois are 16 percent below average. At the University of Illinois -- Urbana, they are 40 percent lower than average. As a result, it has total E&G funding that is 6 percent below the U.S. average, despite substantial state funding. Similarly, the initial funding edge created by state support at Southern Illinois University -- Carbondale is eroded, and total funding at this institution equals the national average for similar schools. The comprehensive sector, by contrast, obtains total revenues that are 13 percent above average per student. The nonmedical universities operate with total revenues that are 18 percent below average. The health-professional institution operates with funds 15 percent below average. In general, the public institutions in Illinois receive an above-average share of funds from state and local appropriations and a lesser share from tuition. This creates a mixed funding profile by institutional sector.

In the independent sector, tuition revenues are 8 percent above average overall; however, there are considerable differences in funding within this sector. Five of the sine sectors function with average or above—average funding, while the other four operate with funds that are 4 to 37 percent below average.

Faculty salaries in Illinois are above average at independent institutions and close to the average at public institutions. However, increases in recent years show that public institutions in this state have lost ground generally. In the public sector, faculty salaries grew 8 percent more slowly than average between 1978 and 1982, while in the independent sector the rate of salary increase equaled the national average.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the state and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per Capita terms.)

Student Ald	,6 89,728,000
Postsecondary vocational-technical education	<pre># Not available (25,751 F1E)</pre>
State boards and conniesione	\$ 5,926,300
Retirement benefite (including educal eccurity)	\$ 0
Fringa benefite	6 34,315,300
Interetate contracts and reciprocity payments	• •
Service functione provided centrally (e.g., computer service, library, telephone, etc.)	<b>6</b> 1,165,600
Centrally administered capital/debt service	• •
Other	6 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the etates that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state \$ 25,683,100^A

Current Funds revenues dedicated to capital purposes:

- Tultion and Fees reappropriated by the state? Yes

#### Other Comments

- 2 Estimate of state funds. In addition, local bond revenues are provided to community colleges; these data are not readily available.
- ** Illinois Building Authority Rental payment

The review of the data by the Illinois Soard of Higher Education revealed that enrollments reported by the public inetitutions are too low, and enrollments reported by the independent institutions are too high. Independent inetitutions received 627 million in state appropriations; only 614.7 million were reported to HEGIS.

(Indexes shown in bold are based on U.S. average = 100)

## INDIANA

#### Recent Trends

For Indiana, fiscal year 1982 was the third straight year in which revenue gains were insufficient to keep pace with enrollment shifts and inflation. Despite a small real-dollar gain in tuition revenues per student (.6 percent), relative losses in state appropriations (6.6 percent) created a 4.3 percent drop in the purchasing power of the public sector. All sectors except the two-year occupational schools had losses, ranging from .7 percent for universities without medical (Ball State University) to 7.4 percent for the public baccalaureate schools.

The cumulative impact of these losses between 1978 and 1982 was a 7.2 percent decline in the funding base of Indiana's public sector. Only 11 other states experienced more stringent fiscal conditions during this period. While inflation -lagging increases in state appropriations were primarily responsible, tuition revenues also grew more slowly than prices and enrollments. The two-year sector in Indiana had the greatest decrease in constant-dollar revenues between 1978 and 1982, losing approximately 115 percent in purchasing power per student. The loss at Ball State was next greatest; the purchasing power of its revenues fell 8 6 percent between 1978 and 1982. The research university with medical program (Purdue University) saw its funding drop 4.4 percent during the period, and the medical university's (Indiana University -- Bloomington) loss was 2.8 percent. The comprehensive and general baccalaureate schools had real-dollar funding declines of 2.1 and 2.4 percent

#### State Financing of Higher Education

Indiana spent \$89 per capita on higher education in FY82, 17 percent below the national average. However, the number of students in the public sector is also below average by 9 percent. Since higher education receives an above-average share of tax funds, the below-average level of state funding is a consequence of the size of the state's budget.

The vast majority of the state's higher education funds are given to the public sector, as is the case in most other states. Indiana operates a large state student-aid program, 10 percent better funded than average. Public institutional support accounts for 90 percent of higher education's budget, which is average, however, actual funding is nearly 20 percent below average.

#### State Tax Buse and Budget

Indiana is both inherently less wealthy than average (by 9 percent, ranking it 33rd among the states) and unusually reluctant to tax the economic base it has. Tax rates in the state are 11 percent lower than average, and only 17 other states have lower rates. As a consequence, the amount of tax funds collected in 1981 was 20 percent below average. Low income-tax rates and a below-average utilization of selective sales-tax capacity account in major part for the low level of taxes collected in Indiana.

According to Census Bureau figures, higher education received 12.9 percent of the total state budget in 1982, a similar share to that received in 1978 and 34 percent above average. Elementary/secondary, education and health and hospitals also received above-average funding. Highways received a typical budget share, whereas public welfare, public services, and other functions garnered smaller budget shares than average.

#### Higher Education Enrollments

Residents of Indiana are 19 percent less likely to enroll in higher education than are residents of other states. This applies in every category of enrollment—in—state public, in—state private, and out of state. Residents of only eight other states show a lesser disposition to higher education. In total, 27 residents per 1,000 attend colleges and universities anywhere, in contrast to national access rates of 34 per 1,000. While these rates of access are comparatively low, they represent an 13 percent improvement from 1979. In addition, above—average numbers of nonresidents enroll in both the public and private sectors in Indiana, thus raising total enrollment rates to some degree.

The structure of higher education in Indiana is unusual, characterized by a heavy emphasis on university education. In Indiana, 80 percent of all public students are enrolled in universities or comprehensive institutions (compared to the national average of only 57 percent). Reflective of this emphasis is the fact that 12 percent of all public-sector students in Indiana are studying at the graduate level (compared to 9 percent nationally). No state has a larger proportion of graduate enrollments, and only five other states enroll as many students at this level.

Indiana's system of public education, given its emphasis on university and graduate-level study, is therefore one of the most expensive public systems to operate. The state's private sector, in contrast, places much less emphasis on university-level study and greater focus on comprehensive and baccalaureate education than is typical.

#### Institutional Finances and Characteristics

In general, Indiana's support per student for public institutions is 10 percent below the national average, since both state funding and enrollments are below average. However, funding per student among different categories of public institutions varies considerably. For instance, Indiana's public research university receives 33 percent less per student than average, and the two-year occupational schools receive 49 percent less than average. State funding for remaining sectors varies, with the comprehensive sector receiving 15 percent more than average, and the remaining sectors receiving below-average amounts to the following degrees: 18 percent less for the medical university (Indiana University -- Bloomington), 5 percent less per student for the university without medical (Ball State), 28 percent less for the three public baccalaureate schools, and \$ percent less for the academic/comprehensive two-year schools.

Funding to public institutions from other sources is strikingly high in Indiana. Tuition revenues are 37 percent above average, gifts 21 percent above average, and other sources 27 percent above average. As a result, revenues are improved in every sector, with the exception of university without medical. Still, only two sectors (the comprehensive institutions and the academic/comprehensive two-year schools) operate with funds equal to or above average for comparable institutions. The two largest sectors (research university with medical and university with medical) function with 20 and 10 percent less, respectively, per student than is typical for similar institutions.

Faculty salaries in Indiana are below average in both the public and the iodependent sectors, by 6 and 7 percent respectively. Below-average rates of salary increase in the public sector from 1978 to 1982 contributed to these low levels. A review of salaries by sector, however, is somewhat surprising. The two large universities, despite operating with funds that are 10 to 20 percent below average, pay their faculty in all three major ranks at rates equal to or close to national averages. By contrast, faculty in the same ranks at the other universities and comprehensive institutions are paid salaries approximately 5 to 12 percent below average for comparable ranks.

1981-82

Additional State and Local Government Funding for Higher Education . Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$ 21,000,000
Postsecondary vocational-technical education	\$ 600,393
State boards and commissions	\$ 2,015,438
Retirement benefite (including social security)	\$ 28,188,000
Fringe benefite .	<b>\$</b> 0
Interstate contracts and reciprocity payments	<b>\$</b> 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>6</b> 0
Centrally administered capital/debt service	\$ O
Other	<b>\$</b> 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences Am practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

## IOWA

#### Recent Trends

While the loszes in purchasing power for public higher education in Iowa were smaller in FY82 than FY81, they still represented the second straight year of decline. The 4 6 percent increase in state appropriations in 1982 was offset by inflation and a 2.5 percent increase in students, and resulted in a net loss of 2.8 percent in real-dollar state support. A small gain in constant-dollar tuition revenues in FY82 was insufficient to counterbalance the drag of state funding changes, and overall funding fell 2.2 percent. Only one sector, the comprehensives (University of Northern lows) experienced any progress in funding, and it was a small one (? percent) Decreases in real-dollar funding in FY82 ranged from 1 6 percent at the research universities to 6.7 percent at the two-year occupational schools.

The value of state funding dropped substantially in Iowa between 1978 and 1982. Although state appropriations of approximately \$345 million to public institutions in 1982 represented a 42.5 percent increase over 1978 levels, enrollments grew at more than two and a half times the national rate, expanding by 150 percent to include nearly 85,000 F1E students. As a result, state funding per student, adjusted for inflation, shrank by 14.1 percent from four years earlier. Fuition revenues, after adjustment for inflation, also declined in the public sector (by 6.3 percent) These losses mean, that the real-dollar base of revenues was reduced by il 3 percent per student at public institutions in lowa. Only three other states (V'yoming, Montana, and Michigan) suffered greater losses in the per-student purchasing power of their public sector. The il a percent loss in constant-dollar revenues per student in lowa was demonstrably more severe than the 2-3 percent decline experienced nationally between 1978 and 1982

All sectors of public institutions were affected by these funding losses, but especially the occupational two-year inscitutions, where funding dropped 197 percent. The next-greatest losses were in the academic/comprehensive two-year sector, where total funding per student fell 108 percent. The largest sector, the research universities cincluding the University of Iowa and Iowa State), suffered the smallest loss but still found its inflation-adjusted funding diminished by 8.1 percent per student.

#### State Linancing of Higher Education

lowa spent \$124 per capita to support higher education in 1982, a level 15 percent above average. This high rate of support is the result of a larger than average share of the state's budget going to higher education. Inas knowledgment of the high percentage of enrollments in

independent institutions, Iowa provides large amounts of state student aid to students in private college. The state provides an average budget share in public institutional support, but given the larger size of the state pie, public institutional support is 22 percent above average. Iowa also provides funding for a state board.

#### State Tax Base and Budget

In tax capacity, Iowa is 2 percent above average. thile its tax rates are 2 percent below average. As a consequence, the state budget is near average. Iowa's tax capacity in ides. largely in high levels of general sales, licenses, farm property, and death and gift transfers. In tax structure, however, does not capitalize heavily on its broad capacity but rather on individual income taxes and property tax. which are the primary source of state revenues.

Iowa allocates unusually large shares of its state budget both to highways and to higher education, 60 and 37 percent larger than average, respectively. Elementary/secondary education also receives a slightly greater than average budget share. Public services and public welfare, by contrast, receive less of the state budget than is generally the case (by 15 percent and 11 percent respectively), though public welfare received more of the state budget in 1982 than in 1978. Higher education's portion of state expenditures also improved from 1978, shifting from 12.5 to 13.1 percent of the budget.

#### Higher Education Enrollments

Although higher education is a major budget priority in the state, residents enroll at nearly average rates. An above-average number of Iowans enroll in privat, in-state institutions, while approximately 5 percent fewer go to out-of-state institutions or to the state's public sector Thirty-five of every 1,000 persons in the state are enrolled in higher education, a figure that is slightly better than the national average.

The size of the public sector (relative to the state population) duplicates the national average. Despite above-average first-time enrollment by residents, above-average enrollment by nonresidents, and a much greater than average number of students enrolled in full-time study, the overall level of enrollment in the public sector equals the average. Iowa's retention rates, 28 percent below average, are the primary reason for the reduced public -sector enrollment. The independent sector, by contrast, is 32 percent larger than usual, with above-average numbers of both residents and nonresidents.

Iowa operates a reintively expensive system of public higher education. Fifty-four percent of its students are enrolled in a search universities, compared to 18 percent of students nationally. Reflecting this structure, Iowa is among the top six states in graduat enrollment, with 12 percent of its statewide enrollments at the graduate level. This contributes further to the expense of its system. Thirty-five percent of the students attend two-year institutions, and the remaining 11 percent are in the state's comprehensive institution (University of Northern Iowa).

The indepen int sector is largely baccalaureate in character, with 71 percent of all independent students in one of 25 such colleges in Iowa. The remaining private " adents are in comprehensive, two-year, or professional iustitutions.

#### Institutional Finances and Characteristics

With above-average state funding to higher education and an average number of students, the level of per-student state support is 22 percent above average in Iowa's public system. . . . y type of public institution shares in this profile, with per-student funding 1 to 11 percent above average. Revenues from other sources also are above average overall in the public sector, although there are variations by segment. The largest sector, the research universities, operates with 10 percent feiger funds than average, while ar other segments receive funding between 4 and 38 percent above average.

In the private sector, funding is mixed. The largest sector, the baccalaureate institutions, is funded at levels 4 percent below the average. The comprehensive sector is similarly funded (3 percent below average). The two-year institutions, on the other hand, vary in funding, operating at levels between 39 percent above average for the academic/comprehensives to 9 percent below average for the occupational two-year schools. This is a dramatic eversal of the 1979 profile, in which the academic/comprehensive two-year schools were substantially below average in total funding.

Faculty salaries at the public research universities and comprehensive institutions are below average by 9 and 8 percent respectively, though faculty at the associate and assistant ranks are paid at rates closer to the U.S. average. Faculty at the public two-year institutions are also paid at below-average rates but by larger margins--16 to 23 percent below average. Rates of salary increase for faculty in both the public and independent sectors were below average between 1978 and 1982.

## **KANSAS**

#### Recent Trends

In fiscal year 1982, public institutions in Kansas experienced a continued erosion in the purchasing power of their funds. For the third straight year, increases in revenues were inadequate to keep pace with inflation and enrollment changes. In FY82, there was a small 3 percent. decline in constant-dollar funding per student (excluding grants and contracts). This loss in total spending power was largely due to the 5 percent drop in real-dollar state support, which outweighed the 74 percent real-dollar gain in tuition funds per student. All sectors of public institutions were affected by these losses except the small occupational two-year schools and the health-professional institution. This latter institution (the University of Kansas Medical Center), in marked contrast to general patterns in the state, had a 44.5 percent gain in FY82 in funding from all sources

The Kansas funding picture for the four years 1978 to 1982 shows a small loss in purchasing power per student of percent), but the loss was not as great as that experienced nationally (2.3 percent). State appropriations to public institutions in Kansas between 1978 and 1982 increased by 54 percent to \$526 million. This rate of growth was 24. percent better than average. Since en pliments in Kansas. increased at approximately the same rais as elsewhere, the inflation adjusted value of state dollar, did improveslightly, by 1 8 percent per student over the tour-year time span. Gains in state funding were not evenly distribute serious 121 categories of schools, and only three relatively small sectors otherway alegories of two-year achools and the health-opoles aonal sector) a owed day gains in inflation-adjusted state funding. All other sectors. experienced crossess of 2 to 103 percent in real-dollar. state funding per student.

faction received and not generally keep up with inflation retween 1971 and 1982, so total revenues per student in constant dollars dipped somewhat airing the period. Again, however, there were significant actor differences. The research university with medical (Kansas State University). had the largest drop in overall tunding in the state losing 12.2 percent in constant-dollar spending power. By contrast, there was a small gain (2 percent) for the research university without medical (University of Kansas) For the five comprehensive institutions in the state, funding for 1978 to 1982 was nearly level, after adjustments for inflation and enrollment. For the small two-year sectors, the picture was mixed. The academic/comprehensive. two year schools had a real-dollar funding drop of 3.6 percent, while the overpational two-year schools lead a real gam of 4.5 percent per student. Support for the mealth eprofessional castitution was virtually unchanged

Between 1928 and 1982, state dollars contributed to public higher education increased from 59 percent of the total revenues to 6.5 percent. Nationally the freud was just incorposite, and state finds shrank from a 60 percent to a 59 percent share. For the independents in Kansas, the period 1978 to 1982 provided an average gain of 101 percent in its spending per student. In the most recent year, FY1982, there was a 2.1 percent gain in inflation-adjusted revenues per student at independent institutions.

#### State Financing of Higher Education

Despite an average state budget, Kansas directs a proportionately greater share of its funds to higher education. At \$140 per capita in 1982, higher education received 30 percent more funds than average. This high level of support ranked Kansas 7th in the nation in per capita funding of higher education, and of these funds, 99 percent went to support public higher education in the state. (This funding would be even higher if the public postsecondary vocational-technical sector were included.) Kansas also provides student and to students attending independent institutions in the state, despite the small size of that sector and the fact that it enrolls only about half the number of state residents than is typical

#### State Tax Base and Budget

Kansas is 9 percent above average in tax capacity but 13 percent below average in tax effort. Tax revenues, at \$979 per capita, were 5 percent below average. Kansas ranks among the top ten states in the nation in tax capacity in commercial and industrial property, farm property, and severance. Kansas obtains above-average tax funds from property taxes, with other leading sources of state tax references being general and selective sales, and individual income.

Higher education and highways are the only two budget categories in the state that receive above-average budget shares. Higher education receives 12.2 percent of the budget, a share 28 percent greater than the norm, though its share in 1982 was smaller than that provided in 1978. The hare of funding for highways was level during this period, though highways continue to receive a share that is nearly 50 percent larger than usual. These above-average shares of the budget come at the expense of public welfare, public services, and other, which receive shares between 9 to 21 percent below average.

#### Higher Education Enrollments

Residents of Kansas do about 4 percent better than average in rates of attendance in higher education. A lower rate of enrollment at the state's private colleges is more than co-pensated for by the significant degree of access pro-ided by the state's public institutions—19 percent above average.

fotal enrollments (by residents and nonresidents) in the public sector are 27 percent above average, eucolling 37.3 FTE students per 1,000 capita. These enrollments result from the fillowing factors. 9 percent above average tirst-time enrollment of residents, twice as many

nonresidents of the contact hat above average full-time study patterns and of the contact. By contrast, the independent sector in Kansa contact and nonresident enrollments and, given the size of the state, is 45 percent smaller than is typical.

The Kansas system of public higher education is relatively more expensive in character than average. There is a heavy emphasis on university-level education and graduate study, which are generally more expensive. In Kansas, 42 percent of students are in universities, compared to 32 percent nationally. In addition, the average size of a public institution in the state is approximately 30 percent smaller than average, creating additional expense.

#### Institutional Finances and Characteristics

Per capita state funding to the public sector is 40 percent above average, while enrollments are 27 percent above average. Although this combination creates a level of per-student state support that is 10 percent greater than average, the structure of higher education in the state dilutes these funds. Kansas State University still functions with 32 percent less per student than other similar institutions, including 29 percent less per student in state support. The University of Kaissas receives per-student appropriations that are 4 percent above the national average; for the comprehensive inst tutions, state support per student is 16 percent below average. On the other hand, the two-year institutions appear to be particularly wellfunded by the state, and the University of Kansas Medical Center also receives above-average state support. These patterns are generally repeated in the total revenue profiles of these schools. In conclusion, then, large state contributions to higher education are somewhat diluted by a large student population that is concentrated in relatively expensive forms of education. Kansas State University. appears to be impacted the most and functions with 32 percent less per student than similar institutions elsewhere.

Faculty salaries are below average at both public and private institutions. In the public sector, with faculty at the upper ranks most affected, these low pay cales were further exacerbated by the below-average increas in faculty salaries between 1978 and 1982.

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown hers. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	\$ 4,531.507
Postsscondary vocational-technical education	<b>5</b> •
State boards and commissions	6 1,274,933
Retirement benefits (including social security)	6 2,785.531
Fringe benefits	. 0
Interstate contracts and reciprocity payments	6 666.125
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	• 0
Centrally administered capital/debt service	\$ C
Other	<b>6</b> 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 0 appropriations to public institutions in the state

Current funds revenues dedicated to capital purposes:

		_	_
	tuition and fees		0
	auxiliary enterprises		0
-	aunitially enterprises		- 1
	other	•	0

Tuition and fees reappropriated by the state? Yes

#### Other Connents

* Kansas' vocational-technical schools have programs for secondary and postsecondary students. The costs and enrollments of the postsecondary component are not separately identifiable.

(Indexes shown in bold are based on U.S. average = 100)

## **KENTUCKY**

#### Recent Trends

While 1982 was not as difficult a year for higher education in Kentucky as the previous year, it still was one of tiscal stringency more pronounced than that seen nationally. Overall, the purchasing power of the higher education dollar fell 3.0 percent in FY82, largely because of a 3 I percent drop in the constant-dollar value of state appropriations. The nearly 1 percent gain in real tuition revenues was overshadowed by the impact on state funds of inflation and enrollment shifts. The two-year sectors were the most severely affected by these constant-dollar declines, experiencing losses in purchasing power of approximately 12 percent per student. The public baccalaureate schools lost 5 0 percent of the value of their tungs, and smaller losses occurred at the research university with medical (University of Kentucky) (14 percent) and the comprehensives (1.2 percent). The university with medical (University of Louisville) was the only sector in Kentucky's public sector to show any progress in funding levels, with a very small gain of 1.1 percent for FY82

In the tour-year period 1978 to 1982, state revenues allocated to public higher education increased by 49 1 percent to \$349 millior. However, with inflation and a 5.4 percent increase in the number of students to support, this hunding increase translated into a 1.9 percent dip in the value of state monies for public higher education. Tuition collections dropped even more, falling 6.9 percent in inflation-adjusted terms. Overall, then, the value of higher education funding in Kentucky from all sources inched downward by 1.7 percent. The impact of these shifts varied by sector the research university with medical (University of Kentucky) and the two-year occupational (Lexington Technical Institute) received the equivalent of level funds during this period, the medical university (University of Louisville) and the academic/comprehensive two-year schools had some improvement in funding (4.9 and 4.3 percent respectively), and the remaining sectors had losses in the 7 to 10 percent range.

the independent sector, there was an inflation-adjusted gain of 2.6 percent per student in FY82 in total revenues and a nearly level position for FY78 through FY82 (+ 4 percent).

#### State Financing of Higher Education

Kentucky spent \$100 per capita in 1982 for higher education, 8 percent below the national average. This level of support is remarkable, given that the state's budget is 24 percent smaller than average, and required.

an extraordinary share of state funds. Almost all of these funds (\$95 out of the \$100 pot) are funneled to public institutions. A small amount supports student aid in both the public and private sectors and also provides indirect support to the public sector for state retirement benefits and state commissions.

#### State Tax Base and Budget

Kentucky is below average in both its capacity to raise taxes and its willingness to do so. As a result, tax revenues collected in 1981 were 28 percent less than the U.S. average. Only six other states had fewer funds to finance public programs: Arkansas, Alabama, Mississippi, Tennessee, New Hampshire, and South Carolina. Kentucky has above-average capacity in some tax categories selective sales, licenses, farm property, and severance taxes. Its tax effort, however, is above average only in individual income, death and gift transfers, and severance taxes.

Higher education, highways, and public welfare all receive above—average budget shares in Kentucky. Health and hospitals receive the smallest relative share of the budget. 27 percent below the U.S. average. Public services are also a relatively low priority, receiving 14 percent less than average. Elementary/secondary education's share of the budget is 5 percent below average. Although higher education is clearly a preferred state activity, its share of the state budget declined somewhat between 1978 and 1982, continuing a drop that has been evident since 1975.

#### Higher Education Enrollments

By national standards, Kentucky, with only 27 per 1,000 residents enrolled in higher education, is a low access state. The national average is 34 per 1,000. This low enrollment is evident in every category, in in-state public and private institutions as well as out-of-state schools. (Only seven other states have a lower rate of enrollment by residents.)

Enrollment levels in public institutions in Kentucky are 16 percent below average, primarily because of low first-time enrollments by state residents (nearly 40 percent below average). However, above-average nonresident enrollment, high retention rates, and large numbers of full-time studen's compensate to some degree and improve enrollment levels in the public sector (to a level 16 percent below average).

Kentucky's public system, while slightly smaller than average in size, is significantly more university/comprehensive oriented and therefore more graduate in character than is usual. Kentucky has 76 percent of its students in the public sector in university or comprehensive institutions, compared to 57 percent nationally. Similarly, graduate enrollment in Kentucky represents 11 percent of students, as contrasted with 9 percent nationally. This structure contributes to the financial requirements of the state's public higher education system.

ΰ

#### Institutional Finances and Characteristics

Kentucky provides 2 percent less state funding to the public sector to support 16 percent fewer students than average. Because of the smaller pool of students, state support per student is high. Kentucky provided \$3,885 per student in 1982, a level 17 percent above average. This funding level was sufficient even to accommodate the state's more expensive structure of education. Every category of public institution is funded by the state at rates that are 2 to 32 percent above the average for similar classes of schools. Only the two-year sector differs from this general profile. Though the two-year sector is relatively small in this state, representing only 15 percent of the state's public students. it is funded at rates that are approximately half the average for such schools. When all sources of general operating funds are considered, a similar profile prevails. That is, all sectors except the two-year schools operate with funds close to or above the average for comparable schools. For the two-year sector, funding is 28 to 35 percent below average.

Despite substantially above-average funding levels, Kentucky's faculty is underpaid in comparison to other states, on average by 9 percent. Recent rates of increase in faculty salaries have ameliorated this to some degree, though salaries at the state's institutions are still under the national mean.

## LOUISIANA

#### Recent Trends

Although state and local appropriations in Louisiana increased 14.1 percent in FY1982, they were unable to keep up with inflation and the substantial growth in enrollments in the state (6.5 percent). As a result, the constant-dollar value of state funds fell 2.6 percent in FY1987 in Louisiana Tuition increases were similarly handicapped and fell 2.3 percent in constant dollars per student. Overall, the result was a 2.3 percent dip in the funding capacity of the state's public system of higher education. Five of the seven sectors in the state were impacted with losses generally about 2 percent. However, the small occupational two-year sector was hit with a 16.5 percent drop in overall purchasing power. By sontrast, the academic/comprehensive two-year sector had a 13.4 percent improvement in inflation-adjusted revenues per student. The health-professional institution (Louisiana State University's Medical Center) also showed gains in real-dollar funding (5.1 percent per student).

Over the longer run, between 1978 and 1982, funding for public higher education in Louisiana improved. State appropriations for public higher education in Louisiana gained 77.7 percent between 1978 and 1982, reaching \$448 million. The gains in state support (when adjusted for inflation) helped create a 9.2 percent increase in overall per-student spending power for the public sector. This general gain in revenues in Louisiana occurred despite a constant-dollar reduction of 2.1 percent in tuition and fees collected per student over the same period.

In contrast to the change between 1981 and 1982, from 1978 to 1982 all categories of public institutions except one were able to achieve real funding improvements. However, it is the largest suctor—research university with medical (Louisiana State University)—that lost ground. Constant-dollar funding for this sector fell 4.8 percent per student during this period.

### State Financing of Higher Education

Louisiana spent \$121 per capita on higher education in 1982, a rate of support 12 percent above average. The vast share of these higher education funds is channeled to the public sector to support the institutions, state boards and commissions, and the vocational/technical schools. Louisiana also allocates a small amount for state student aid.

#### State Tax Base and Budget

Louisiana has above-average tax capacity but is extremely reluctant to tap this inherent wealth. Although the state ranks 7th among the states in tax capacity, tax revenues in the state are far below expected levels, and Louisiana ranks 31st in tax revenues collected. Louisiana's tax potential is based on very high corporate income, commercial and industrial property, severance taxes, and selective sales tax. Louisiana's tax structure emphasizes severance and general sales taxes, and 59 percent of the state's tax revenues emanate from these two sources alone.

The state's budget priorities include health and hospitals, highways, and other, the three public functions that receive above—average shares of state expenditures. Public welfare is the only function that receives an unusually small share of the budget, though that has improved since 1978. Higher education also received a smaller share of the state's budget in 1982, about 10 percent below average.

### **Higher Education Enrollments**

Louisiana residents appear to underenroll in higher education. Yet, when the 75,960 FTE students in the state's vocational/technical schools are considered, residents then appear to enroll in higher education at above-average rates, and almost exclusively through attendance at the state's public institutions. But because postsecondary vocational-education enrollments were not in the past included uniformly within federal higher education reporting systems, the remaining analysis in this report does not include those enrollments or the finances associated with them.

The public sector in Louisiana is 4 percent smaller than average because of below-average enrollment rates by both state residents and nonresidents. Above average retention rates and a tendency to full-time study increase enrollments somewhat but not enough to equal the average.

Louisiana's system of higher education emphasizes education at comprehensive institutions, and 57 percent of public students are enrolled in one of the state's eight such institutions. This reliance on comprehensive schools is nearly double the U.S. average. By contrast, the two-year segment is unusually small in this state, enrolling only 8 percent of public students, compared to the U.S. average of

38 percent. The public sector is far more graduate than is typical, and Louisiana is among the leading six states in its relative emphasis on graduate studies.

The independent sector is also heavily graduate in focus, with 62 percent of its students in either a university or a comprehensive institution; 27 percent of independent students are enrolled at the graduate level, nearly 50 percent more than average. The independent sector in Louisiana is very small, however, about half the average size.

### Institutional Finances and Characteristics

The gains in stale appropriations over the part few years in Louisiana have improved the funding of public institutions in the state. In 1982, state support per student was 12 percent above the U.S. average In general, public institutions in Louisiana operate with 3 percent more funds per student than the U.S. average. Operating revenues, however, vary substantially by sector in Louisiana and are strongly diluted given the requirements of university/comprehensive institutions and graduate studies in the state. Only two sectors, the very small sector of academic two-year schools and the health-professional institution, function with average or better funding. All other sectors operate with a funding base that is 9 to 40 percent below average. And the largest institution in the state, Louisiana State University, has total funding that is 21 percent less per student than medical research universities in other states.

While state funding per student is above average overall, tuition revenues are nearly one-quarter below typical levels, and private gifts and grants are less than half the usual level. Further, government grants and contracts are one-quarter smaller than usual. Combined, then, the profile by sector is generally one of below-average support.

Despite low funding, faculty salaries at Louisiana State University are above average for the upper ranks. At the comprehensive institutions, faculty salaries for full professors are 8 percent below average; however faculty in other ranks are better paid. Faculty at the two-year institutions are paid at below-average rates despite an above-average operating base. Between 1978 and 1982, faculty salaries in the public sector grew nearly one-fifth faster than those in other states.

^{***} Tuition is not an offset to appropriations. It is separately appropriated as self-generated dollars - tuition and fees.

## MAINE

#### Recent Trends

State appropriations for public higher education in Maine increased only 6.9 percent in fiscal year 1982. Given the 10.0 percent change in prices from 1981 to 1982 (using the Higher Education Price Index) and a 1.4 percent increase in enrollments, this meant a 4.2 percent reduction in state support. Constant-dollar increases in tuition revenues outpaced inflation, netting a 4.8 percent improvement. Nevertheless, total revenues per student slipped 1.4 percent. Three of the five categories of public institutions experienced some loss. By contrast, independent institutions achieved a 5.6 percent improvement per student in total E&G revenues, tied largely to a 4.5 percent tuition gain after adjustment for inflation.

Between 1978 and 1982, a 54.7 percent increase in appropriations to public institutions (14th highest in the nation) was not enough to compensate for the 9.4 percent increase in students and the 44.3 percent (HEPI) inflation for the period. As a result, appropriations per student in constant dollars declined 2.0 percent, below the national average decrease of 5.3 percent. Tuition revenues increased 5.7 percent, almost exactly matching inflation. Total educational and general revenues per student in constant dollars declined 1.7 percent, less than the national average decline of 2.3 percent. Faculty salaries increased 32 percent during the four years. However, when the 50.2 percent increase in the CPI is taken into account, faculty in public institutions lost 12 percent of their purchasing power.

Tuition revenues in the independent sector increased 73 percent between 1978 and 1982, more than enough to offset inflation. This amounted to a 12.5 percent increase per student in constant dollars. Total educational and general revenues per student in constant dollars increased 11.2 percent, 10th highest in the nation. This was considerably above the U.S. average of 3.7 percent. Faculty salaries during the four years increased 3.9 percent, representing a 7.5 percent loss in purchasing power.

### State Financing of Higher Education

Maine operates a very small public higher education system relative to its population. It enrolled 21.9 FTE students per 1,000 population in fall 1981, compared to the national average of 29.2 per 1,000 population. Total appropriations of \$6.7.80 per capita for higher education were 37 percent below the national average, ranking the state 47th in the nation. Appropriations per student of \$2,630 were 21 percent below average, ranking the state 44th. Institutions made up the difference with high tuition revenues and revenues from other sources, so that total funding per student was at the national average.

The state appropriated \$1.6 million for student aid, equal to \$1.40 per capita, compared to the national average of \$4.20. Postsecondary vocational-technical institutes, enrolling 3,386 students, received \$10.2 million in state appropriations. State funds were not used for the support of independent institutions.

#### State Tax Base and Budget

Maine is a tax-poor state and had a potential tax capacity of \$816 per capita in 1981. This was 2i percent below the national average of \$1,030, ranking the state 47th in the nation. The reason for this was low tax potential in individual income (31 percent below the national average), corporate income (29 percent below the national average), property (23 percent below average), and selective sales (12 percent below average).

Maine's tax effort was 13 percent above average, with a state rank of 9th, and the state collected \$115 million in additional property tax revenues due to above—average rates. Collected revenues of \$924 per capita were only 10 percent below average, ranking Maine 30th in tax funds available to support public services.

Maine allocated 7.3 percent of its tax revenues to higher education, substantially below the 10.5 percent national rate. As a result, appropriations of \$67.80 per capita for institutional support, student aid, and other were 37 percent below the national average, ranking Maine 47th.

If the total operating budget of Maine (including nontax and federal transfers) is considered, highways and public welfare received a larger share of the budget relative to national average allocations, and higher education and health and hospitals received a proportionately smaller share

#### **Higher Education Enrollments**

In FY82, Maine had 26 residents per 1,000 population attending college somewhere, 23 percent below the national average of 34 residents per 1,000 population. Although 20 percent more residents than average migrated to other states for higher education, below-average attendance rates in both the public and independent sectors in Maine reduced the overall access level for state residents.

The 28 colleges and universities in Maine enrolled 34,598 FTE students in fall 1981. The public system, consisting of 12 institutions enrolling 24,738, had 72 percent of the students, making it a very small public system relative to the state's population. University enrollment, as a share of the public total, was larger than the national average (40.3).

versus 32.1 percent); four-year college enrollment was slightly larger (30.5 versus 28.3 percent); and two-year college enrollment was much smaller (13.0 versus 37.8 percent). The 16 independent institutions enrolled 9,860 FTE students in fall 1981, a slightly smaller than average private enterprise relative to population.

In 1982, the number of high school graduates per 1,000 population in Maine was above the national average, yet only 33.3 percent entered state public institutions, well below the national average of 62.5 percent. In-migration of nonresidents was 1.4 times the national average. Retention was at the national average; full-time enrollments were slightly above average. In the independent sector, residents made up 40 percent of the enrollments below the national level of 60 percent.

### Institutional Finances and Characteristics

State appropriations to Maine's public institutions overall were 21 percent below national rates. The funding of individual types of institutions, however, was varied. The University of Maine at Orono, with an enrollment of 9,977 FTE students, received appropriations that were 23 percent below the national average for universities without medical programs (a state rank of 26th out of 28). The University of Southern Maine, enrolling 5,681 students, received appropriations 12 percent below average for comprehensive institutions. The state's four public two-year occupational colleges, enrolling 3,207 FTE students, received appropriations 33 percent above average (ranking the state 10th out of 46).

All sectors except the two-year occupational schools received above-average tuition revenues per student. As a result, overall total educational and general revenues per student almost equaled the national average. At the nonmedical university, E&G revenues were 1 percent lower than average, and those at the comprehensive institutions were 7 percent above average. Both institutional types emphasized research and public service, and instructional expenditures per student were about 25 percent below average. Instructional expenditures at the four two-year occupational colleges were 36 percent above average, reflecting the higher level of state appropriations.

The state's seven independent baccalaureate institutions, which enroll a majority of the private students, received tuition revenues 67 percent above average. Together with above-average gifts and grants and other revenues, total educational and general revenues for these schools were 63 percent above average. Consequently, expenditures for instruction and academic support were well above average, as were faculty salaries.

## **MARYLAND**

### Rocent Trends

The value of funding for public higher education in Maryland was unchanged in fiscal year 1982. Although there was a small drop (.1 percent) in appropriations per student after adjustment for inflation, this dip was neutralized by a real-dollar gain of 2.9 percent in tuition collected, leaving total funding (excluding government grants and contracts) unchanged in terms of constant dollars per student. Given that the national average was a 2.0 percent decrease, Maryland's keeping pace with inflation and shifting enrollment meant that the state was among 17 states in the nation that did not lose ground. The profile by sector was mixed, however. The large two-year (academic and comprehensive) sector had a small improvement in its purchasing power (2.1 percent), while the health-professional sector showed impressive gains of 11.0 percent in total funding, even after adjustment for inflation and enrollment changes. All other sectors, however, saw the value of their funding base eroded in fiscal year 1982, generally by about 5 percent (except the two-year occupational sector, where it dropped by 1 percent). When viewed from a longer time perspective, 1978 to 1982, the fiscal profile for the state is somewhat more negative. During that period, despite an increase of nearly 42 percent in state appropriations and a very small increase in enrollments (.3 percent), inflation caused a drop in real-dollar state funding per student of 2.2 percent. However, the patterns among the different sectors varied. Two of the six sectors (the general baccalaureates and the two-year occupational schools) received more state support and total funding in real dollars per student. The other four sectors, by contrast, lost ground in terms of total revenues. but by relatively small amounts (from .7 percent to 2.8 percent).

Tuition revenues in the public sector just kept pace with inflation and enrollments, and showed a small .4 percent gain in real-dollar terms. Total revenues adjusted for inflation and enrollments, however, fell by nearly 1.6 percent overall.

The independent sector managed a major gain in support levels, with adjusted revenues per student rising by 8.4 percent. All segments among the independent institutions, except the baccalaureates and the two-year occupational schools, saw some improvement in the purchasing power of their funds

### State Financing of Higher Education

Higher education receives a nearly average share of the state's budget. The state's distribution of these funds within higher education, however, is atypical. Both the institutions the ves and students (through financial aid) receive below-average shares, and the "other" category receives an unusually large portion (prarly four times larger than

usual). The state provides student aid and direct appropriations to both the public and independent sectors. The support given the independent sector is somewhat surprising given the small size of the sector and its low enrollment of residents.

#### State Tax Base and Budget

Maryland has an average tax base on which to draw, with particular strengths in individual income, general sales, residential property, and death and gift transfers. The state makes an above-average effort to tax this capacity, exerting the 12th-greatest tax effort in the country. Its tax structure places major emphasis on individual income taxes, taxing at a rate 81 percent above average and ranking the state 8th nationally in its reliance on this tax source. Tax revenues in 1981 were \$1,084 per capita, 5 percent higher than average.

Census figures for 1982 suggest that the state's budget exceeds the U.S. average by 7 percent. In Maryland, only public welfare and health and hospitals receive significantly below-average shares of the state budget, each receiving approximately 20 percent less than is typical. Higher education receives about 4 percent less than average, with all other functions receiving above-average shares, particularly highways (at 23 percent above) and other (with 10 percent more). Higher education's share of the state budget improved only slightly between 1978 and 1982.

### Higher Education Enrollments

Maryland residents enroll in higher education at rates just below the U.S. average—33 residents per 1,000, in contrast to the national average of 34 per 1,000. The result is an index of 98 for Maryland. This is due to higher than average rates of attendance by residents at the state's public institutions as well as at institutions in other states. Enrollment of residents at independent institutions in the state are lower by nearly half as compared to the U.S. average. By contrast, nearly 40 percent more residents go to institutions in other states in pursuit of higher education.

First-time enrollment of residents at Maryland's public institutions is 7 percent greater than average. Enrollment of nonresidents at public institutions is 22 percent above average. However, these above-average enrollment rates are diminished by a somewhat below-average retention rate and by the enrollment of more part-time students than is usual. Still, total FTE enrollment in the public sector is nearly average, and 29.1 FTE students per 1,000 capita enroll in public institutions. By contrast, enrollment in the private sector in Maryland is 43 percent lower than average.

The mix of institutions in Maryland's public higher education system is fairly similar to the national mix, except that there is a greater emphasis on research universities and no enrollments in other universities (nonresearch). As a result, the overall coet of the system, in broad terms, is probably still quite similar to that of other states.

### Institutional Finances and Characteristics

State appropriations per student are 5 percent below national rates. The funding of individual groups of public institutions, however, is more varied. For instance, the nonmedical research university (University of Maryland at College Park) receives substantially below-average funding from the state, 28 percent less than similar schools elsewhere. The comprehensive schools also receive less per student than is typical for such schools (by 10 percent). For the health-professional school, the funding profile is even worse, with the state providing 52 percent less per student than average. By contrast, all other sectors are relatively well funded by the state, receiving support that ranges from 4 to 53 percent above average for similar schools.

Maryland's tuition revenues per student are 29 percent higher than average for public institutions. In total revenues (excluding grants and contracts), four segments operate with above-average or close to average funding (the comprehensives, the baccalaureates, and both categories of two-year schools). Two public segments are substantially below average in funding levels (College Park, indexed at 72, and the Baltimore Professional Schools, indexed at 53).

Overall, faculty salaries in the public sector are below average, by 5 percent, though for upper-rank faculty they are generally closer to the average. At College Park, for example, the salaries of the major professorial ranks are about 3 to 4 percent below average even though the overall average for all ranks is 9 percent below the U.S. average. Salary increases between 1978 and 1932 in Maryland's public sector lagged behind national patterns noticeably, increasing at rates 16 percent below average. However, increases at the Baltimore Professional Schools were impressive, especially in light of diminished support during this period. At this institution, salary gains were 50 percent ahead of national rates for similar schools.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in par capita terms.)

Student Aid	6 5,858,854
Postsecondary vocational-technical education	<b>6</b> 0
State boards and connissions	\$ 12,165,411
Retirement benefite (including equal security)	\$ 67,616,000
Fringe benefite	<b>6</b> 0
Interstate contracte and reciprocity payments	8 1,479,267
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>6</b> 0
Centrally administered capital/debt service	<b>6</b> 0
Other (Operating expenditures for extension instruction, Center for Environmental Studies, and Agriculture Experiment Static	\$ 12,791,101 on)

### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 27,048,000 (setimate) appropriations to public institutions in the state

Current Funde revenues dedicated to capital purposes:

- tuition and feee \$ 0 - auxiliary enterprisee \$ 0 - other \$ 0

Tuition and feee reappropriated by the etate? Yes

## **MASSACHUSETTS**

#### Recent Trends

Compared to the circumstances of public higher education in other states, 1982 was a banner year in Massachusetts. Adjusted for inflation and enrollment shifts, total funding for the public sector in the state evidenced a 5.8 percent improvement. Only three other states (Texas, Moutana, and Tennessee) had more favorable financial circumstances in FY1982. Much of the gain in Massachusetts was attributable to tuition revenues, which increased by 12 1 percent in constant dollars per student. The state also increased its contribution in absolute funding by 11.2 percent, which when adjusted for price increases and enrollment shifts, left a 1.2 percent real-dollar improvement in support. All but two sectors shared in these funding improvements. However, the nonmedical university (the University of Massachusetts -- Amherst) was one large sector that did not, and its overall financial base dipped 4.7 percent in FY1982. The baccalaureate sector (North Adams State) also saw its funding eroded (by 8 9 percent) Gains in the other sectors ranged from 2 0 percent at the other professional schools to 38.4 percent for the health-professional school (the University of Massachusetts Medical School -- Worcester)

While these gains were more ravorable than the trends between 1978 and 1982, the four-year time span nevertheless represented a time of overall improvement for the state's public higher education system, with the total funding improving 3-3 percent net of inflation and enrollment gains. As was the case in fiscal year 1982, this improvement in funding was attributable to significant increases in tuition revenues. Tuition collections between 1978 and 1982 grew in real-dollar terms by 55-4 percent and were sufficient to counteract the 13.8 percent erosion in overall funding. General gains in funding put Massachusetts as one of only 20 states with any improvement between 1978 and 1982, and the state ranked 13th nationally in this regard

The independent sector in Massachusetts also registered gains in funding during the four-year period, despite a real-dollar loss of 6 percent in fiscal year 1982. Total revenues increased 48 percent in constant dollars per student. In general, the universities in the independent sector (except the four universities without medical programs) fared well, gaining between 8.7 and 23.6 percent in real-dollar support.

### State Financing of Higher Education

Despite these recent gains and a very large pool of tax revenues, Massachusetts directs a below-average share of funds to higher education. As a result, per capita funding of higher education at \$67 is 38 percent below average (Inly three states—New Hampshire, Vermont, and Pennsylvania—spend less per capita on higher education than Massachusetts.

The state apportions 82 percent of its higher education funds to the public institutions in the state, a smaller share than average. Another 4 percent of funds go to student aid, primarily for those students at independent institutions, and the remaining 14 percent is allocated to public postsecondary education for other support (retirement benefits, the state board, and health-related support).

#### State Tax Base and Budget

Massachusetts is just below average in inherent wealth, but through a massive tax effort, collects tax revenues that are 29 percent above average. (Only Alaska, New York, and Washington, D.C. have higher tax rates than Massachusetts.) Massachusetts has strong economic bases to tap in both individual income and residential property. Its tax structure emphasizes both of these, along with corporate income taxes and other categories of property tax. Despite low sales taxes, the state collects a level of tax revenues that ranks it 6th in the nation. In property :axes of all types—residential, commercial, and farm—Massachusetts is 2nd in the nation in tax rates. The state ranks 4th in the United States in its corporate income taxes and 9th in personal income taxes. Nearly 80 percent of its tax revenues come from these sources.

Although the Massachusetts budget is 3 percent larger than the national average, higher education receives the lowest share of the budget of any public function in the state. In 1982, for instance, only 4.7 percent of the state's expenditures went for higher education, less than half of the national average. Highways, public services, and elementary/secondary education also received lower shares of the state's budget. On the other hand, public welfare in particular and other functions received greater than usual portions of the state's budget. Between 1978 and 1982, higher education increased its share of the state budget slightly, from 4.3 to 4.7 percent. By contrast, most other states allocate 9.6 percent of their state budget to this function.

#### Higher Education Enrollments

Massachusetts residents show a tremendous disposition toward higher education, with 41 of every 1,000 Massachusetts residents enrolling. The national average rate is 34 per 1,000. Only Arizona achieves a higher rate of access for its population. In Arizona, access is attributable to a large public system of higher education in the state; in Massachusetts, above—average enrollment of residents primarily is due to high enrollment at the state's independent institutions and at out—of—state institutions. Access through these nonconventional channels is sufficient to compensate for below—average registration in the state's, public institutions, which enroll 19 percent fewer residents than average.

Because nonresidents are also less likely to select public institutions in Massachusetts, total FTE enrollment in the public sector is 24 percent below average (22.1 FTE students per 1,000). Sixty percent of the state's students are at independent institutions. Only the District of Columbia enrolls a greater proportion of its residents in private colleges and universities. A below-average share of public enrollments in Massachusetts is in the university sectors, and an above-average share is at comprehensive institutions. In the private sector, the opposite situation prevails, with 54 percent of the students at universities—4 share twice as large as average.

### Institutional Finances and Characteristics

State funding of public higher education and student enrollment in the public sector are both below average. And because relative state funding is even smaller than the student base, per-student appropriations are 26 percent below the U.S. average.

Despite the recent erosion of state support, the University of Massachusetts—Amherst receives average funding from the state, and the Worcester Medical School receives nearly 30 percent more than average. By contrast, all other sectors receive below-average funding from the state in comparison to their counterparts elsewhere (7 to 39 percent less).

Revenues from other sources (tuition, gifts, other) in the public sector do not compensate sufficiently. As a result, four of the seven public institutional categories in Massachusetts function with funding that is 12 to 29 percent below average. Of those that do no', the University of Massachusetts Medical School—Worcester is the major exception and is funded at rates 89 percent better 'han average, and the University of Massachusetts—Amherst achieves funding levels that are 6 percent better than average. And the academic two-year schools have average funding. The independent sector in Massachusetts, reflecting its dominant role in the state, is generally very well funded. Private institutions in the state generally operate with revenues that are 17 percent better per student than is typical.

Faculty salaries in the public sector equal the national average, largely as a result of above-average gains between 1978 and 1982. Faculty salaries are strongest at the University of Massachusetts--Amberst, where they are above average by 15 percent. Salaries at the public comprehensive and baccalaureate institutions are also above average overall. In other categories of public institutions, salaries are below average. Faculty at the private institutions in the state are paid far better, receiving 14 percent more in salaries than their counterparts elsewhere, a position that saw relative improvement between 1978 and 1982.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education · Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$ 14,546,300
Postsecondary vocational-technical education	\$ 0
State boards and commissions	\$ 3,378,366
Retirement benefits (including social security)	\$ 50,180,559
Fringe benefits	\$ 0
Interstate contracts and reciprocity payments	<b>\$</b> 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>\$</b> 0
Centrally administered capital/debt service	<b>\$</b> 0
Other (Medical, De al. Physical & Uccupational herapy and Veterinary Medic.ne Seats for Independent Institution	\$ 1,745,521

### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIC reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current funds revenues dedicated to capital purposes:

- tuition and fees \$ 0
- auxiliary enterprises \$ 0
- other \$ 0

furtion and Fces reappropriated by the State? Yes

Other Connents

(Indexes shown in bold are based on U.S. average = 100)

## **MICHIGAN**

#### Recent Trends

Funding for public higher education in Michigan continued to lose ground in fiscal year 1982, given inflation and enrollment changes, the value of total revenues was reduced by 1.7 percent. However, this loss was far less severe than that of FY81, when funding dropped 9.3 percent in real-dollar terms. Still the overall profile for the state between 1978 and 1982 was one of the most severe in the U.S., and constant—follar revenues per student slumped by 12.1 percent. Only Montana and Wyoming saw their funding bases eroded more seriously than Michigan's. No sector was spared in this decline, and the purchasing power of revenues in Michigan's public sector fell at rates ranging between 5.1 and 16.9 percent.

Losses in state appropriations were primarily responsible for the loss in purchasing power. Between 1978 and 1982, the 21-2 percent increase in appropriations was completely offset by inflation and enrollment shifts, creating a 2-0-0 percent loss in the value of state monies for public higher education. Tuition gains in this period were real but small creating a 4-4 percent constant-dollar increase. Still, the impact of low increases in appropriations resulted in a 12-1 percent overall loss in purchasing power for the state's public institutions.

Losses in constant-dollar revenues per student also were evident in the independent sector, but to a much lesser degree. For these institutions, purchasing power fell 1.5 percent in inflation-adjusted figures.

#### State Financing of Higher Education

Although Michigan's total budget is above average, higher education's slice of the tax revenues is smaller than average, resulting in per capita support that is 11 percent below average. Michigan provides a small amount of institutional support to independent institutions, while public institutions receive the vast majority of higher education funds. Although the share of the higher education budget directed to public institutions is 4 percent greater than average, its size in per capita terms is 7 percent below the U.S. average. Five percent of the state's higher education budget provides student aid in both the public and independent sectors.

### State Tax Base and Budget

Michigan has a close to average tax base and is more will ag to tap that capacity than is the average state. Due to this above-average effort, the state collects 12 percent

more in tax revenues than the typical state. In all major tax categories (sales, property, individual and corporate income) Michigan's level of economic activity is nearly congruent with national patterns. Its tax structure, though, heavily emphasizes both income (especially corporate income) and property taxes, which combined account for 71 percent of total tax revenues collected.

According to census figures, higher education is a favored state function in Michigan and receives an above-average share of the state's budget. This contradicts the profile depicted by tax revenues alone, which suggested that higher education receives a below-average share of the state's budget. Census figures indicate that public welfare, health and hospitals, and elementary/secondary education also receive larger budget shares than average. Highways, public services, and other obtain smaller relative shares. Higher education's budget portion slipped somewhat between 1978 and 1982, from 10.6 to 10.3 percent. Health and hospitals was the big gainer during this period, with its budget share jumping from 8.5 to 10.2 percent.

### Higher Education Enrollments

Residents of Michigan are more likely to pursue higher education than are residents of other states (index 107). The public sector enrolls 19 percent more residents than is typical. This high enrollment of residents in the public sector more than compensates for the below-average registration of residents at private colleges in the state and at institutions outside Michigan.

Reflecting this large resident enrollment, Michigan's public institutions enroll 16 percent more students per 1,000 capita than does the average public system. By contrast, the independent sector in Michigan is only 63 percent as large as the U.S. average.

Michig...n's students are somewhat more likely to be enrolled in a university. Thirty-six percent of Michigan's public students are studying at one of the four universities in the state. Generally, only 32 percent of students receive this type of education. Ten percent of all students are involved in graduate studies, a rate nearly one-quarter greater than the national average. Michigan's focus on university education and graduate study creates a relatively more expensive education system to support.

#### Institutional Finances and Characteristics

Because public enrollment levels in 1982 were greater than state appropriations, state support per student was 20 percent below average, a much weaker financial picture than in 1979 when such state support was 6 percent below the norm. However, income from tuition and private gifts was substantially greater than average, causing total E&G revenues per student (excluding government contracts) to approach the average (index 97).

However, all categories of public institutions in Michigan operate with below-average total funding, except the university with medical school (Wayne State University). That institution obtained 15 percent more revenues per student than its counterparts in other states. In particular, three of the four universities in the state are funded at levels 7 to 11 percent below those of similar institutions in other states. Given the significant graduate emphasis of these institutions, the level of underfunding is even more serious. The eight two-year occupational schools are 6 percent below average in total E&G funding per student, while the academic/comprehensive two-year schools are 2 percent below. Michigan's public institutions are below average in government grants and contracts by 16 percent.

Public -sector faculty salaries in general are 4 percent better than average, and most institutional caucyories generally follow this profile. However, salary increases between 1978 and 1982 lagged behind national rates, growing 10 percent more slowly than elsewhere.

## **MINNESOTA**

#### Recent Trends

State appropriations to public higher education in Minnesota increased 17.1 percent in fiscal year 1982. The increase was sufficient to cover both inflation and a 3.1 percent increase in enrollments, netting a 3.1 percent real-dollar increase in state funding. Even though tuition increases did not keep up with inflation (tuition revenues slipped 1.4 percent per student in constant dollars), total E&G revenues (excluding grants and contracts) per student increased 1.6 percent in FY82. This gain followed two years of retrenchment in state appropriations and an FY81 loss in overall purchasing power of 8.3 percent. Still, the overall four-year profile for public higher education indicates a notable decline in spending power.

State appropriations to public institutions increased 38.3 percent from 1978 to 1982, far less than necessary to cover enrollment growth of il.1 percent (7th highest in the nation) and inflation of 44.3 percent (HEPI). The result was a 13.7 percent decline in appropriations per student in constant dollars. The national average decline for the four-year period for all public institutions was 5.3 percent. Public institutions also failed to raise tuition adequately to offset inflation, creating a 3.7 percent loss per student in constant dollars, which resulted in a 5.3 percent reduction in total educational and general revenues. During the four-year period, public faculty salaries increased 31 percent. However, when salaries are adjusted for a 50.2 percent increase in the CPI, faculty experienced a 13 percent loss in purchasing power.

From 1978 to 1982, Minnesota's 39 independent institutions increased tuition revenues by 66 percent to offset inflation, netting a 50 percent gain in constant dollars; the national average was 28 percent. Revenues from other sources also increased sufficiently, so total educational and general revenues per student in constant dollars rose 7.1 percent. Faculty salaries increased 38 percent during the four years, representing a loss in purchasing power of 8 percent.

#### State Financing of Higher Education

Minnesota operates a slightly larger than average public higher education system, enrolling 30.5 FTE students per 1,000 population in 1982, compared to the national average of 29.2 students per 1,000 population. State and local appropriations per capita of \$92.70 were 5 percent below the national average. Thus, appropriations of \$3,037 per student were 9 percent below the national average, ranking Minnesota 33rd. Above—average revenues from gifts and grants and other sources improved the total funding of Minnesota's public institutions to 6 percent above average.

State appropriations for higher education of \$127.80 per capita were 19 percent above average. Of this amount, \$101 million was used to support Minnesota's postsecondary vocational-technical education program, which enrolled 34,977 FTE students in fall 1981. The

state provided \$7.70 per capita for student financial aid (ranked 5th), which is 1.8 times the national average. Minnesota appropriated \$4.9 million for state boards and commissions and \$6.7 million for interstate contracts and reciprocity payments. Thirty cents per Capita went to support independent institutions.

#### State Tax Base and Budget

Minnesota had a tax capacity of \$1,031 per capita in 1981, equal to the national average, ranking the state 21st in the nation. The state has no specific taxes that have noteworthy high or low capacity.

The tax effort of Minnesota was 9 percent above national average rates, with a state rank of 11th. As a result of average capacity and above-average effort, collected tax revenues of \$1,121 per capita were 9 percent above average, ranking Minnesota 13th in the nation in tax funds available to support public services.

Minnesota allocated 11.4 percent of its tax revenues to higher education, substantially above the national rate of 10.5 percent. As a result, appropriations of \$12.7.80 percapita for institutional support, student aid, and other support were 19 percent above the national average.

If the total operating budget of Minnesota (including nontax and rederal revenues) is considered, highways and public welfare received an above-average share of the budget, and higher education received a somewhat below-average share.

#### **Higher Education Enrollments**

Minnesota has a high level of access for state residents, with 37 residents per 1,000 population in FY82 attending college somewhere; the national average was 34 residents per 1,000 population. Above-average attendance rates at both public and independent in-state institutions created this high level of access (9 percent above average). A large proportion, 73 percent, attended public institutions within the state; 19 percent attended independent institutions in state; and 8 percent attended institutions out of state. The national distribution was 73 percent, 18 percent, and 9 percent respectively.

The 69 colleges and universities in Minnesota enrolled 167,627 FTE students in fall 1981. In its 30 institutions, the public system enrolled 125,586 students (75 percent), making it an average-size system relative to the state's population. University enrollment, as a share of the public total, was larger than the national average (39.1 versus 32.1 percent); four-year college enrollment was substantially larger (39.3 versus 28.3 percent); and two-year college enrollment was much smaller (21.6 versus 37.8 percent). Minnesota has a large system of noncollegiate vocational-technical institutes, which enrolled 34,977 FTE students. The 39 independent institutions in the state

enrolled 42,041 FTE students in fall 1981, a slightly larger private enterprise than average relative to population.

Minnesota had a much larger number of high school graduates per 1,000 population than the U.S. average, yet only 43.8 percent entered state public institutions, well below the national average of 62.5 percent. In-migration of nonresidents to attend Minnesota's public institutions was below the national average. Student retention and full-time enrollments were above average. In the independent sector, residents constituted 63 percent of enrollment, above the national level of 60 percent.

#### Institutional Finances and Characteristics

The University of Minnesota, with 39 percent of the state's public enrollment, received state appropriations per student 13 percent below average for research universities with medical programs. Tuition and fees at the University of Minnesota were equally below average. However, the university collected 84 percent more revenue from private gifts and grants than average and, together with above-average revenues from other sources, secured total E&G revenues (excluding government contracts) per student that were at the national average. Expenditures for instruction and academ'c support at the university were nearly average, while research and public service were above average. Full-time faculty salaries were slightly below the national average for a research university with a medical program.

The state's 6 comprehensive and 18 two-year academic colleges received state appropriations that were 31 and 22 percent below average, respectively. The two-year academic colleges received above-average tuition revenues and secured other funding to raise total B&G revenues per student to within 5 percent of the national average. The . comprehensive colleges, on the other hand, received low tuition revenues: their total educational and general revenues per student were only 28 percent below average (a state rank of 42nd out of 45). Instructional expenditures per student were well below average for both the comprehensive and the two-year ruilcies. The two-year colleges, however, received a high level f academic support. Faculty salaries were nearly average, suggesting that a high student-faculty ratio may be contributing to the low instructional expenditures per student

Minnesota's 14 independent general baccalaureate colleges accounted for 59 percent of the independent enrollments in the state in 1982. They received slightly above-average tuition revenues and secured total educational and general revenues per student that were 6 percent above average. Expenditures for instruction and academic support were above average, and public-service expenditures per 1,000 population were 5.6 times the average. Full-time faculty salaries for these institutions averaged 11 percent above the national norm.

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

S.udent Rid	\$ 28,625,300
Postsecondary vocational-technical education	\$101,168,500 (34,977 FTE)
State boards and conmissions	\$ 4,896,532
Retirement benefits (including social security)	<b>6</b> 0
Fringe benefits	<b>\$</b> 0
Interstate contracts and reciprocity payments	8 6,745,800
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	, \$ 1,854,000
Centrally administered capital/debt service	<b>\$</b> 0
Other	<b>\$</b> 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 10,764,184** appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and feet \$ 0
- auxiliary enterprises \$ 0
- other \$ 0

Tuition and Fees reappropriated by the state? A

#### Other Comments

- * Tultion and fees are not remitted to the state and consequently are reported as tultion and fees.
- ** For vocational-technical schools

Summer: Minnesota Higher Education Coordinating Board

(Indexes shown in bold are based on U.S. average = 100)

## **MISSISSIPPI**

#### Recent Trends

Fiscal year 1982 was a difficult one for public higher education in Mississippi, with the value of funding from all sources (except government grants and contracts) falling 6.4 percent in constant dollars per student. Only eight other states had more constrained financial circumstances than Mississippi. The loss in constant-dollar funding support is attributed to the erosion of gains in state appropriations and tuition by inflation and above-average enrollment increases. Only the health-professional sector (the University of Mississippi Medical Center) did not participate in these losser, instead having a small improvement (2.1 percent) in the purchasing power of its funds.

When looked at over a longer period, the funding profile in the state was more positive. Despite the losses in FY \$2 and FY80, public higher education institutions in Mississippi did have funding gains sufficient to cover inflation and enrollment shifts, even if the gains were inadequate to provide any significant expansion in funding. Monies from the state increased by .6 percent in constant dollars per student between 1978 and 1982 while the value of tuition revenues fell 2.7 percent, creating a static profile of a .1 percent gain beyond inflation and enrollment shifts. Still, in comparison to the fate of most other states, this is a positive profile, placing Mississippi among the 20 states that showed any gains during this four-year period. In general, most categories of public institution saw improvements in funding, ranging from nearly 1 to 25 percent. The key exceptions were the two-year sectors, with losses between 6 and 9 percent in constant dollars per student. The independent sector in Mississippi saw its purchasing power per student fall by 4.4 percent.

#### State Financing of Higher Education

Mississippi spent over \$276 million for higher education in fiscal year 1982. This amounted to \$109 for each citizen, a level just slightly greater than the U.S. average.

Although Mississippi is the poorest state in the nation as measured by its capacity to raise taxes, the state places a high priority on higher education. It allocates 16 percent of all tax revenues (and 12.4 percent of its total budget, including federal revenue-sharing funds) to this public function. The allocations far exceed the tax and budget shares of most states, and almost all of the funds--98 percent--are channeled into direct support of institutions. The remaining 2 percent provide student aid as well as support for the State Board of Trustees.

#### State Tax Base and Budget

Mississippi's capacity to raise taxes is 28 percent below the national average. In fact, its capacity places it among the lowest six states in the country in six of the ten tax categories studied in this report. Further, the state does not fully utilize its capacity, taxing at rates 5 percent below average. Mississippi's tax system emphasizes general sales taxes, licenses, and severance taxes. As a result, Mississippi collected only \$698 per capita for public purposes. The national average level is \$1,030 per capita. Mississippi tax revenues are therefore 32 percent lower than the U.S. average. This tax position improves somewhat with the infusion of federal revenue—sharing funds. In 1982, the state's total expenditure was \$1,577 per capita, which was 18 percent below the average.

Mississippi devotes above-average shares of its state budget to highways (index 169), health and hospitals (index 153), and higher education (index 130). All other public functions receive smaller than usual shares: elementary/secondary education (index 91), public welfare (index 88), public services (index 74), and other miscellaneous functions (index 72). From 1978 to 1982, the budget share for higher education increased from 11.9 to 12.4 percent of the budget.

#### Higher Education Enrellments

In 1982, resident enrollment was 31 per 1,000 population (even though postsecondary vocational-education enrollments are excluded). This rate places Mississippi just below the U.S. average. However, if the postsecondary vocational-education sector were included, the state would rank far better in its provision of access. Residents of this state enroll at above-average rates at the public institutions in the state. Overall access, however, is driven down by reduced rates of attendance at private institutions in Mississippi and at institutions in other states. Mississippi residents are half as likely as other states' residents to attend private institutions in the state or to migrate to other states for higher education.

Despite a somewhat smaller number of high school graduates than the U.S. average, the first~time entrance rate of state residents is 2.6 percent above average. With 3.6 percent more out-of-state students than average and a high degree of full-time (versus part-time) study, the enrollment rate in public institutions is 9 percent higher than the national average. This is sufficient to overcome the system's lower retention rate.

Mississippi's system of public education is more university oriented and places less emphasis on

comprehensive-institution enrollments than is the case in most states. Also, the institutions in the system are, on average, smaller in size. These two characteristics indicate a system that is more expensive to operate than average. However, the lower emphasis on graduate enrollments in Mississippi's public system offsets this to some degree.

#### Institutional Finances and Characteristics

The profile thus far depicts a public higher education system funded at levels 9 percent above average and enrolling 9 percent more students than is typical. The equivalence of these numbers brings appropriations per student to the U.S. average (index 100).

In 1982, Mississippi allocated \$3,329 per student to public institutions. However, the distribution of these funds varied by sector. Two sectors—the research university with veterinary medicine (Mississippi State University) (index 103) and the general baccalaureates (Alcorn State University and Mississippi Valley State University) (index 121)—were funded by the state at levels above those of similar schools elsewhere. The remaining sectors were funded at rates below average. The universities without medical programs (University of Mississippi and University of Southern Mississippi) and the health—professional school (the University of Mississippi Medical Center) had the lowest relative levels of funding—12 and 19 percent, respectively, below levels for similar institutions across the United States.

Revenues from tuition are below average (index 94) in the public sector, revenues from private sources are 42 percent below average, and those from other sources are 3 percent above average. Government grants and contracts are also substantially above average, by 17 percent. In net figures, total E&G revenues per student (excluding government grants and contracts) are just below the U.S. average, however, with noticeable variations by sector. In total funding, only one sector operates with above-average funding (the general baccalaureates); two with close to average funding (the medical research university and the three comprehensive institutions); and the remaining four function with funding that is 6 to 30 percent below

Despite some improvements in faculty salaries in the public sector between 1978 and 1982, in all categories of institutions (public and private) all ranks are below national rates. Overall, faculty salaries for public institutions in Mississippi are 18 percent below the U.S. average while those at independent institutions are 34 percent below.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS inetitutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	1	3,510,953
Postsecondary vocational-technical education		
State boards and connissions		1,958,456
Retirement benefits (including eocial escurity)		0
Fringe benefits		0
Interstate contracts and reciprocity Payments		0
Service functione provided centrally (e.g., conputer eervice, library, telephone, etc.)		0
Centrally administered capital/debt service		0
Other .	•	0

#### Clarification of Inetitutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of etate and local appropriations to public inetitutions in the state

Current Funde revenues dedicated to capital purposes:

- tuition and feee 8 6 - auxiliary enterprises 9 6 7 8 6

Tuition and Fees reappropriated by the state? Yes

#### Other Connente

A Miseieeippi hae a large poeteecondary vocational education sector. State apprapriations and enrollment levels for this sector, however, were not reported for FY82 and therefore not included here.

Risecessppi does not require that tuition be appropriated. Tuition and feee not epent in one year may be rebudgeted for expenditure at the university in a later year.

## **MISSOURI**

#### Recent Trends

For public institutions in Missouri, fiscal year 1982 was one of major erosion in their funding base. After adjustment for inflation and enrollment growth, these institutions had to function with 8.7 percent less in support than the previous year. Only five other states had a more difficult fiscal year than Missouri. All major categories of public institutions were touched by this funding decline. The loss in revenues was almost entirely due to the decline in state spending for higher education, as state appropriations fell absolutely by 3.3 percent even though there was a 2.8 percent increase in the number of students to suppoit. When inflation is factored in as well, the real extent of the decline in state support amounts to a 14.6 percent loss.

The long-term picture (1978 to 1982) was nearly as bad, with constant-dollar state funding per student dropping 16.9 percent and total funding shrinking 8 6 percent. Again, all major sectors were affected, with purchasing Bower dropping by 4.7 to 18.9 percent.

#### State Financing of Higher Education

Missouri spent approximately \$355 million for higher education in 1982 (\$14 million less than the year before), which translates into \$72 per capita (33 percent below average). Three percent of these funds-were used for state student aid, and nearly all of the remaining funds were funneled to public institutions for general institutional support. No direct state aid is provided to independent institutions in this state (other than financial aid to students) despite above—average enrollment of residents in this sector.

#### State Tax Base and Budget

Missouri ranks 31st in the nation in its level of taxable wealth. The state has notably better than average tax capacity in two categories: farm property and licenses. The state is close to average in the categories of general sales, selective sales, and individual income. In the remaining five categories, the state is substantially below average in tax capacity.

The combined effect of these conditions is a tax capacity percent below average. The state, however, is markedly restrained in its use of even this reduced tax capacity. Only 81 percent of it is tapped, resulting in tax revenues even further below average. The state collected 25 percent less than the U.S. average in tax revenues. \$770 per capita, in contrast to the average state revenue of \$1,030 per capita.

Health and hospitals, highways, public services, and elementary/secondary education are all priority state functions and receive above-average shares of the state and

local government budgets. Higher education's share is average, while public welfare and other functions are given relatively smaller portions of the state's funds (indexed at 85 and 52 respectively). Higher education's share of the state's budget improved slightly between 1975 and 1952, from 9.3 to 9.5 percent.

#### Higher Education Enrollments

Missouri residents are about 10 percent less likely to enroll in higher education than is average. Although above-average numbers of residents attend independent institutions in the state, fewer residents enroll in the state's public institutions or in out-of-state institutions. The effect is an enrollment rate of 30 students per 1,000 residents, which contrasts with the U.S. average of 34 per 1,000.

Enrollments (resident and nonresident) in the public sector are 11 percent below average despite a larger than average number of high school graduates, above-average nonresident enrollment, and an above-average tendency toward full-time study. The low enrollment rates appear largely to be tied to a lower rate of first-time enrollment by state residents and a lower retention rate.

More of Missouri's public students enroll in comprehensive institutions than in either universities or two-year institutions. Still, surprisingly, given the lower rates of enrollment at universities, there are nearly as many graduate students enrolled in the public sector as is average.

Enrollments in the private sector are more graduate in nature, despite a similar reliance on university level of study. Approximately one-third of the state's students are enrolled at private institutions, a much larger percentage than is typical.

#### Institutional Finances and Characteristics

As we have seen, enrollments are 11 percent below average in the public sector while state funding is 28 percent below average. Because there are relatively fewer state dollars for the number of students to be supported, appropriations per student are 19 percent below average. However, individual sectors differ dramatically within that profile.

Among the largest public institutional sectors in the state (the research university with medical program, the seven comprehensive institutions, and academic/comprehensive two-year schools), state support ranges from 13 to 29 percent below average (13 percent less at the medical research university, 29 percent less at the comprehensive institutions, and 16 percent less at the academic/comprehensive two-year schools). If other

sources of revenues are considered, these profiles improve some, such that the medical research university (the University of Missouri—Columbia) operates with 5 percent below-average funds, the comprehensive institutions at 25 percent less than their comparison group, and the two-year schools with 3 percent less. The net result is that all sectors except two in Missouri function with below-average support. The two-year occupational schools receive two and a half times the typical funding levels per student and the medical university (the University of Missouri—Kansas City) obtains 16 percent more per student than its counterparts in other states.

Funding levels at the private institutions vary substantially. Only three sectors are well funded: the research university with a medical program (Washington University), the medical university (St. Louis University), and the two-year academic schools. All other private institutions operate with 11 to 58 percent less funds per student than the U.S. average for similar institutions in other states.

Faculty salaries lost ground generally in Missouri between 1978 and 1982, increasing at rates 14 percent slower than average. With these losses, faculty in the public sector are pald at levels 12 percent below average, and levels in the private sector are 10 percent below average. Full professors appear to be the most directly impacted, and almost none of the averages for this rank are close to the U.S. average.

## MONTANA

#### Recent Trends

Following two consecutive years of constant-dollar losses, fiscal year 1982 provided a marked improvement in funding for public higher education in Montana. A 25.8 percent increase in state appropriations outpaced both inflation and a 3.1 percent enrollment growth, netting a 10.8 percent per-student improvement in state funding. Tuition revenues also showed real gains. As a result, congtant-dollar revenues per student improved by 8.5 percent. But while 1982 gains were noteworthy, they were not sufficient to compensate for earlier losses.

Montana's funding of public higher education declined seriously between 1978 and 1982. Although appropriations increased 48.0 percent, enrollment growth was 11.0 percent. 8th highest in the nation. When this growth is combined with an inflation rate of 44.3 percent (HBPI), appropriations per student in constant dollars declined 7.6 percent. Tuition increases also failed to keep pace with inflation, resulting in a substantial 13.6 percent loss per student in constant dollars. As a result, total educational and general revenues per student in constant dollars declined a sizable 14.4 percent, the second-worst decline in .he country. By comparison, the national average decline in educational and general revenues was 2.3 percent. Faculty salaries at public institutions increased 34 percent between 1978 and 1982. However, given the 50.2 percent increase in the CPI during that period, faculty lost il percent of their purchasing power.

Enrollment at Montana's six independent colleges increased 14.1 percent between 1978 and 1982. Tuition revenues at the three independent general baccalaureate colleges matched inflation, with a 3.2 percent gain per student in constant dollars. The baccalaureate institutions also substantially increased their revenues from other sources. As a result, total educational and general revenues per student in constant dollars increased 11.3 percent. Faculty salaries at the independent institutions increased 30 percent during the four years, representing a loss in purchasing power of 13 percent.

#### State Financing of Higher Education

Relative to the state's population, Montana operates a large public higher education system, enrolling 34.1 FTB students per 1,000 population in FY\$2, compared to the national average of 29.2 per 1,000 population. However, total appropriations for higher education of \$94.10 per capita were 13 percent below average. Thus, appropriations per student of \$2,756 were 17 percent below average, ranking the state 41st. Revenues from other sources were even lower, failing to improve total funding for most types of institutions.

Montana provided no appropriations for student financial aid, whereas the national average for student aid was \$4.20 per capita. Independent institutions received no state support.

#### State Tax Base and Badget

Montana is a tax-rich state and had a potential tax capacity of \$1,169 per capita in 19\$1, 14 percent above the national average of \$1,030. This capacity, ranked 10th in the nation, was the result of high tax potential in general sales (13 percent above the national average), property (17 percent above average), and severance (202 percent above average).

1

Montana's tax effort was \$ percent below average, with a state rank of 28th. The state has no general sales tax and lost \$216 million in potential revenues in 1981 as a result. This was partially offset by an additional \$111 million in property taxes because of above-average property rates. As a result of high capacity and low effort, collected tax revenues of \$1,080 per capita were only 5 percent above average, ranking Montana 15th in the nation in tax funds available to support public services. Montana allocated \$.7 percent of its tax revenues to higher education, substantially below the 10.5 percent national rate. As a result, appropriations for institutional support and student aid of \$94.10 per capita were 13 percent below the national average, ranking Montana 34th in the nation. Still, this is an improvement over the previous year, when Montana's support of higher education per capita was 25 percent below the national average, ranking the state 40th in the nation.

If the total operating budget of Montana (including nontax and federal revenues) is considered, highways and elementary/secondary education received an above-average share of the budget, while higher education, public welfare, and health and hospitals received a proportionately smaller share.

#### Higher Education Enrollments

In FY\$2, Montana had 33 residents per 1,000 population attending college somewhere, near the national average of 34 residents per 1,000 population. A large proportion, \$3 percent, attended public institutions within the state; only 7 percent attended independent institutions in state; and 10 percent attended institutions out of state. The national distribution was 73 percent, 18 percent, and 9 percent respectively.

The 15 colleges and universities in Montana enrolled 29,965 FTE students in fall 1981. The public system, consisting of 9 institutions, enrolled 27,175 (or 9i percent) of the students, making it a large system relative to the state's population. Sixty-eight percent of the students eurolled in comprehensive institutions, well above the national average (24.4). In contrast, the two-year academic schools enrolled only 6.5 percent of the students, well below the 37.8 percent national average. The six independent institutions in the state enrolled 2,790 FTE students in fall 1981, a very small enterprise relative to population.

In 1982 Montana had a larger number of high school graduates per 1,000 population than the national average, yet only 46.1 percent entered state public institutions in 1982, below the national average of 62.5 percent. In-migration of nonresidents to attend Montana's public institutions was 1.3 times the national average. Retention and full-time enrollments were also above average. In the independent sector, residents made up 68 percent of the enrollment, above the national level of 60 percent.

#### Institutional Finances and Characteristics

The comprehensive institutions (Montana State University and the University of Montana) received appropriations per student 15 percent less than average, and tuition revenues per student 24 percent below average worsened the situation. As a result, total educational and general revenues (excluding government contracts) per student were 15 percent below average. Instructional expenditures ware 5 percent below average, whereas academic support per student was at the average. Full-time faculty salaries were 6 percent below average. The state's single public baccalaureate college, Bastern Montana College, received average state appropriations but tuition revenues too low to meet the national average for total educational and general revenues. The three two-year academic colleges obtained above-average state support but received very low tuition revenues per student (5th lowest in the country).

The state has six small independent colleges, which generally received tuition revenues too low to meet the national average for educational and general revenues. The two two-year colleges, Salish Kootenai Community College and Dull Knife Memorial College, obtained special funding from other revenues, gifts and grants, and government contracts. This allowed them to fund instruction and academic support at a level substantially above the national average.

Additional State and Equal Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	•
Postsecondary vocational-technical education	
State boards and COMMISSIONS	\$
Returement benefits (including social security)	\$
fringe benefits	
Interstate contracts and reciprocity payments	•
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	•
Centrally administared capital/debt service	•
Other	

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current funds revenues dedicated to capital purposee:

- tuition and fees
- auxiliary enterprises
- other

Tustion and fees reappropriated by the state?

Other Connents

## **NEBRASKA**

#### Recent Trends

Appropriations for public higher education in Nebraska increased an average of 40.4 percent from 1978 to 1982. However, enrollment growth of 6.4 percent and an inflation rate of 44.3 percent (HEPI) caused an 8.5 percent decline in appropriations per student in constant dollars. All sectors except the general baccalaureate and the occupational two-year schools shared in the losses. Tuition revenues also declined by 3.6 percent in real value per student, resulting in an overall 6.0 percent decline in total educational and general revenues per student in constant dollars. Faculty salaries at public institutions increased 38 percent; however, when salaries are adjusted for a 50.2 percent CPI inflation rate for the four years, faculty lost 8 percent of their purchasing power.

At Nebraska's 15 independent institutions, tuition revenues declined by 1.7 percent in constant dollars per student. However, these institutions increased revenues from other sources to achieve a significant 14.7 percent improvement in total aducational and general revenues per student in constant dollars. This was the 7th-highest increase in the country for the four year-period.

#### State Financing of Higher Education

Mebraska operates a large public higher education system relative to its population and in FY82 enrolled 35.2 FTE students per 1,000 population, compared to the national average of 29.2 per 1,000. Per capita appropriations of \$129 for higher education were equally high, 20 percent above average. Thus, appropriations of \$3,597 per student were 8 percent above average, ranking Nebraska 17th. Total educational and general revenues per student were also 8 percent above average.

Nebraska appropriated no funds for student financial aid, whereas the national average was \$4.20 per capita. The state appropriated \$2.5 million for state boards and commissions and \$1.4 million for interstate contracts. Independent institutions received no state support.

#### State Tax Base and Budget

Nebraska has nearly average potential tax wealth and liad a tax capacity of \$997 (25th in the nation) in 1981, 3 percent below the national average. The state has tax potential higher than average for farm property, yet lower potential than average for taxing individual and corporate income and residential and commercial property. Nebraska's 1981 tax effort was 5 percent below the national average, with a state rank of 25th; in 1980, the state's effort was 2 percent above average, ranking is 17th. Nebraska collected \$12 million in additional property taxes because of above-average rates, but this was more than offset by a \$68 million loss in potential general sales taxes.

and a similar loss in individual income taxes because of below-average rates. As a result, collected tax revenues of \$945 per capita were 8 percent below average, ranking Nebraska 26th in the nation in tax funds available to support public services.

Nebraska allocated a high 13.7 percent of its tax revenues to higher education, substantially above the 10.5 percent national rate. As a result, appropriations of \$129 per capita for institutional and other support were 20 percent above the national average, ranking Nebraska 9th in the nation.

If the total operating budget of Nebraska (including nontax and federal revenues) is considered, highways and higher education received a larger share of the budget relative to national averages, while public welfare received a proportionately smaller share.

#### Higher Education Excellments

In FY82, Nebraska had 39 residents per 1,000 population attending college somewhere, a rate 15 percent above the national average of 34 per 1,000 population. A large proportion, 82 percent, attended public institutions within the state; 13 percent attended independent institutions in state; and only 5 percent attended out-of-state institutions. The national distribution was 73 percent, 18 percent, and 9 percent respectively. Thus, enrollment at the state's public institutions should be credited for the above-average access level achieved by state residents.

The 31 colleges and universities in Nebraska enrolled 70,426 FTE students in fall 1981. The public system, consisting of 16 institutions, enrolled 55,653 (79 percent) of the students, making it a large system relative to the state's population. University enrollment, as a share of the public total, was proportionately larger than the national mix (38.9 versus 32.1 percent); four-year college enrollment also was larger (33.8 versus 28.3 percent); and two-year college enrollment was much smaller (22.9 versus 37.8 percent). The 15 independent institutions in the state enrolled 14,773 FTE students in fall 1981, an average-size enterprise relative to population.

In 1982, Nebraska had a larger number of high school graduates per 1,000 population than the national average, and 83 4 percent entered state public institutions well above the corresponding national entrance rate of 62 5 percent. In-migration of nonresidents to attend Nebraska's public institutions was just below the national average rate Student retention at public institutions was below the national average, and full-time enrollments were slightly above average. In the independent sector, residents made up 49 percent of enrollment, below the national level of 60 percent.

#### Institutional Finances and Characteristics

The University of Nebraska—Lincoln, enrolling 21,656 students, received state appropriations 12 percent below average and collected tuition revenues 18 percent below average. It also secured total educational and general revenues (excluding government contracts) per student 12 percent below the average for research universities without medical programs. As a result, its expenditures for instructional and academic support were below average, although the university's public—service program was funded at 14 times the national average per 1,000 capita. Faculty salaries at the university were nearly average.

The rtate's three comprehensive colleges, enrolling 16,763 students, were severely underfunded, primarily because of appropriations 33 percent below average (the 3rd-lowest level in the country). Expenditures for instruction perstudent were underfunded by 25 percent as compared to the national average.

On the other hand, the state's four two-year occupational colleges, which enrolled 9,125 students, were well funded by the state (24 percent above average) and secured total educational and general revenues per student 20 percent above average. Most favorably treated were the state's two baccalaureate colleges and five two-year academic colleges. They received state appropriations 39 and 51 percent above average, respectively. The latter level of support ranks Nebraska 4th in the nation in state support of two-year academic colleges.

Creighton University, a comprehensive school, is the largest independent institution in Nebraska. Although Creighton received average tuition revenues, it secured above-average gifts and grants and other revenues. As a result, total educational and general revenues (excluding government contracts) per student were 66 percent above average. The seven independent baccalaureate institutions received funding slightly below average.

Ilarification of Institutional financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tustion and fees
- auxiliary enterprises - other

\$ 0 \$ 5,739,945*

Tuition and Fee: reappropriated by the state? No

#### Other Consents

The lask force for building renewal appropriates funds for repair, energy conservation, and to provide access for the handicapped

Source: Mebraska Coordinating Commission for Postsecondary Education

(Indexes shown in bold are based on U.S. average = 100)

^{*} Used to return building bond issues on university and state college campuses after current expenditures are paid.

## **NEVADA**

#### Recent Trends

Nevada's 49 9 percent increase in appropriations for public higher education from 1978 to 1982 was affectively neutralized by a 16 5 percent increase in enrollments (highest in the nation) and 44 3 percent inflation (HEPI). Thus, appropriations per student in constant dollars declined 10.8 percent. Moreover, tuition revendes did not increase adequately to offset inflation, resulting in an 8.7 percent loss in purchasing power per student. As a result, Nevada's six public institutions sustained an average loss of 5.7 percent in total educational and general revenues per student in constant dollars. Faculty salaries increased 37 percent, but a 50.2 percent increase in the CPI during the four years decreased faculty purchasing power by 9 percent.

#### State Financing of Higher Education

Nevada operates a public higher education system smaller than average and in FY82 enrolled 252 FTE students per 1,000 population, compared to the national average of 292 per 1,000 population. However, the state appropriated a disproportionately low amount for higher education, \$7810 per capita, 28 percent below the national average. Thus, appropriations per student of \$2,966 were Il percent below average, ranking the state 36th. Revenues from private gifts and grants and other sources slightly improved total funding relative to national averages. Nevada appropriated no funds for student financial 2d, whereas the national average was \$420 per capita. The state appropriated \$2.2 million for centrally provided service functions and \$745,000 for state boards and commissions.

#### State Tax Base and Budget

Nevada is a tax-rich state and had a potential tax capacity of \$1,524 per capita in 1981 (3rd in the nation), 48 percent above the national average of \$1,030. This capacity was the result of a very high tax potential in general sales (167 percent above the national average), selective sales (41 percent above average), individual income (25 percent above average), and residential property (21 percent above average)

Nevada's tax effort, however, was 38 percent below the national average rate, ranking the state lowest in the nation Nevada has no individual income or corporate income taxes, in 1981 losing \$269 million and \$45 million in potential collections as a result. The state taxed general sales at a rate 57 percent below average, resulting in a loss of \$310 million. Surprisingly, selective sales were taxed at rates above average, tor additional revenues of \$125 million. Because of this combination of high capacity and low effort, collected tax revenues of \$939 per capita were 9 percent below average, ranking Nevada 29th in the nation in tax lunds available to support public services.

Nevada allocated 8.3 percent of its tax revenues to higher education, significantly below the 10.5 percent national rate. The combination of low revenues and a low allocation rate resulted in per capita appropriations of \$78.10 for institutional support and other support, 28 percent below the national average, ranking Nevada 41st in the nation.

If the total operating budget of Nevada (including nontax and federal revenues) is considered, highways, public services, and health and hospitals received a larger share of the budget than average, while elementary/secondary and higher education and public welfare received a proportionately smaller share.

#### Higher Education Enrollments

In FY82, only 26 residents per 1,000 population in Nevada attended college somewhere, a rate 22 percent below the national average of 34 per 1,000. The lower rates of access are directly tied to lower rates of attendance within the state, as 15 percent more residents than average traveled to other states for higher education.

Nevada's six public colleges and universities enrolled 21,328 FTE students in [all 1981. The public system is smaller than average relative to the state's r., "lation. University enrollment, as a share of the public total, was proportionately slightly larger than the national level (33.1 versus 32.1 percent); comprehensive college enrollment was also larger (32.5 versus 24.4 percent), and two-year college enrollment was smaller (34.4 versus 37.8 percent). There are no independent institutions in the state reported in this study.

Nevada had a smaller number of high school graduates per 1,000 population than the national average. Moreover, only 38.8 percent entered state public institutions in 1982, well below the national average of 62.5 percent. In-migration of nonresidents was 26 percent below average. Retention was more than twice the national average, and full-time enrollments were below average.

#### Institutional Finances and Characteristics

The University of Nevada ~-Reno enrolls approximately one—third of the students. Appropriations of \$4,444 per student to the Reno campus in 1982 were 17 percent above average for universities with medical programs. However, the university received very low tuition revenues (ranking 13th out of 16 states), which lowered total educational and general revenues per student to only 7 percent above the US average. Instructional expenditures of \$2,874 per student were 11 percent below average. Public service expenditures of \$13,237 per 1,000 population were 27 times the national average.

At the University of Nevada -- Las Vegas (6,928 students), appropriations of \$2,810 per student were 10 percent below the U.S. average. However, substantial gifts and grants and revenues from other sources increased total educational and general revenues to 10 percent above the national average for comprehensive institutions. Although instructional expenditures per student were relatively low, all other functions were financed at above the average national rate.

The state's four two-year academic colleges received appropriations that were 21 percent below average for this type of institution (ranking 39th out of 46 states). Combined with low tuition revenues, the institutions received total educational and general revenues per student that were 21 percent below average. As a result, instructional expenditures and faculty salaries were both below average.

## **NEW HAMPSHIRE**

#### Recent Trends

Between 1978 and 1982, New Hampshire increased its appropriations for public higher education by 15.8 percent. the 2nd-lowest increase in the country. The average increase nationally was 44.2 percent. With an enrollment growth of 5.8 percent and an inflation rate of 44.3 percent (HEPI), appropriations per student in constant dollars declined 241 percent, again the 2nd-largest decline in the U.S. New Hampshire's Il public institutions attempted to remedy this situation by increasing tuition revenues by 56 percent and by securing additional funding from other sources. In this they only partially succeeded, as total educational and general revenues per student in constant dollars declined by 9.7 percent. Only five other states had more severe losses in the constant-dollar value of their operating budgets. In New Hampshire, there were funding setbacks in each of the individual years profiled in this report-fiscal years 1982, 1981, and 1980. Faculty salaries at the public institutions increased only 29 percent during the four years. If inflation is taken into account, faculty lost 14 percent of their purchasing power.

Enrollment at the 14 independent institutions in the state increased 22.0 percent between 1978 and 1982, the 6th-largest increase in the nation. These institutions increased tuition and revenues from other sources to offset both the enrollment growth and inflation, and total educational and general revenues per student in constant dollars grew by 2.3 percent. Faculty salaries increased 40 percent, one of the highest increases in the country during the four-year period. Faculty sustained only a 7 percent loss in purchasing power, which was due to inflation.

#### State Financing of Higher Education

New Hampshire operates a small public higher education system and enrolled 22.6 FTE students per 1,000 population in 1982, compared to the national average of 29.2 per 1,000. Appropriations for higher education were proportionately even smaller, \$40.0 per capita, 63 percent below the national average of \$107.70. Thus, appropriations per student of \$1,753 were 47 percent below the national average, ranking the state last in the nation. To offset low appropriations, New Hampshire made extensive use of tuition revenues. By charging more than twice the national average rates, the state achieved nearly average total funding per student.

The state appropriated \$ 30 per capita for student financial aid, compared to the national average of \$4.20, and \$189,000 for state boards and commissions. Independent institutions in New Hampshire received no state government support

#### State Tax Base and Budget

New Hampshire has slightly less tax wealth than average and had a potential tax capacity of \$983 per capita in 1981 (28th in the nation), 4 percent below the national average of \$1,030. The state had above-average capacity in general and selective sales and below-average tax potential in personal and corporate income and commercial

New Hampshire's tax effort was 26 percent below national average rates, with a state rank of 46th. The state has no general sales tax with a resulting loss in 1981, of \$254 million in potential revenue. The low tax rate for individual income resulted in an additional loss of \$159 million. These losses were partially offset by the additional \$206 million collected in property taxes because of above-average rates. Due to average tax capacity and low tax effort, the state's collected tax revenues of \$726 per capita viere 29 percent below the national average, ranking New Hampshire 47th in the nation in tax funds available to support public

New Hampshire allocated only 5.5 percent of its tax revenues to higher education, far below the national average of 10.5 percent. Because of low tax revenues and a low allocation rate, appropriations of \$40 per capita for institutional support, student a. 1, and other support were 63 percent below the national average, ranking New Hampshire last in the nation.

If the total operating budget of New Hampshire (including nontax and federal revenues) is considered, highways received a larger share of the budget than national average allocations, and health and hospitals received a proportionately smaller share. Higher education's share of the budget declined somewhat between 1978 and 1982. falling from 9.2 percent to 8.9 percent.

#### **Higher Education Enrollments**

Access for residents of New Hampshire in FY82 (at 25 residents per 1,000 population) w s 25 percent below the national average. The national average was 34 residents per 1,000 population. Despite above-average attendance outside the state and at independent institutions in the state, lower access to public in-state institutions was largely responsible for the reduced access for residents.

The 25 colleges and universities in New Hampshire enrolled 39,764 FTE students in fall 1981. The public system, consisting of 11 institutions, enrolled 21,163 (53 percent) of the students, making it a small public system relative to the state's population. University enrollment, as a share of the public total, was proportionately much larger than the

national mix (52.1 versus 32.1 percent), as was baccalaureate enrollment (28.1 versus 3 9 percent); two-year college enrollment was much smaller (19.8 versus 37.8 percent). The 14 independent institutions in the state enrolled 18,601 FTE students in fall 1981. Relative to population, it was the 5th-largest private enterprise in the country relative to population.

In 1982, New Hampshire had a larger number of high school graduates per 1,000 population than the U.S. average, yet only 27.0 percent entered state public institutions, well below the national average rate of 62.5 percent. In-migration of nonresident students was 2.2 cimes the national average. Retention was above the national average, as were full-time enrollments. In the independent sector, residents made up 30 percent of enrollments, far below the national level of 60 percent,

#### Institutional Finances and Characteristics

State appropriations in New Hampshire were substantially below average for all types of institutions in the public sector. Hardest hit were the two baccalaureate institutions, which had appropriations per student that were 50 percent below the national average (ranking last among 39 states). The nonmedical university (University of New Hampshire), enrolling half of the public students, received appropriations 38 percent below average. Tuition at all public institutions was well above average. At the nonmedical university, tuition revenues were 2.2 times the national average, highest in the nation. The university was also very successful in securing funding from private gifts and grants and other sources. As a result, total educational and general revenues per student were 10 percent above average. This is a remarkable demonstration of funding higher education through institutional initiative and private means. The nonmedical university emphasizes research and public service and had substantially above-average funding in both areas. Expenditures for instruction, on the other hand, were 17 percent below average. The same pattern of emphasis also prevails at the baccalaureate and two-year academic colleges. Revenues in the other sectors of public higher education were between 4 and 17 percent below

In the independent sector, Dartmouth remained one of the better-funded medical universities in the country. Its total educational and general revenues per student were nearly twice the national average. The five baccalaureate colleges received funding 9 percent below the national average. The two two-year occupational colleges and the four professional colleges were underfunded by about 30 percent, compared to national averages.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	\$ 271,371
Postsecondary vocational-technical education	<b>\$</b> 0
State boards and commissions	\$ 188,583
Retirement benefits (including social security	\$ 0
Fringe benefits	<b>\$</b> 0
Interstate contracts and reciprocity payments	<b>\$</b> 0
Service functions provided centrally (e.g., computer service, library, telaphone, etc.)	<b>\$</b> 0
Centrally administered capital/debt service	<b>\$</b> 0
Other	\$ 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences an practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

## **NEW JERSEY**

#### Recent Trends

New Jersey increased appropriations to public institutions 35 4 percent from 1978 to 1982. However, this was more than offset by enrollment growth of 3.1 percent and inflation of 443 percent (HEPI). As a result, appropriations per student in constant dollars fell 9.0 percent, with some loss in purchasing power in fiscal years 1980, 1981, and 1982. Tuition revenues at public institutions also failed to keep pace with inflation, declining 5.1 percent in constant dollars per student. Consequently, total educational and general revenues per student in constant dollars fell 6.4 percent, placing New Jersey in the bottom third of all states. The national average decline for ail public institutions was 2.3 percent. Faculty salaries at public institutions increased 40 percent, but when inflation is taken into account, there was a 7 percent loss in purchasing power for the four-year period.

Enrollment at the 27 independent institutions in the state increased 3.1 percent from 1978 to 1982, substantially below the 106 percent national increase. Tuition revenues more than matched inflation creating a 3.5 percent gain in constant dollars per studen. Revenues from other sources also improved in real amounts, leading to an 8.0 percent increase in total E&G revenues per student in constant dollars.

#### State Financing of Higher Education

New Jersey operates a very small public higher education system relative to its population and in FY82 enrolled 22.0 FTE students per 1,000 population, compared to the national average of 29.2 per 1,000 population. Total appropriations per capita of \$88 for higher education were correspondingly low, giving the state a rank of 38th. Consequently, appropriations per student of \$3,167 were 5 percent below the national average, ranking the state 26th. Even though tuition revenues were high, revenues from other sources were insufficient to raise the level of total funding to the national average.

New Jersey appropriated \$5.60 per capita for student financial aid (ranking 8th), which was 33 percent more than the national average. The state also provided \$11.10 per capita for retirement and fringe benefits (\$74.5 million) and state boards and commissions (\$4.3 million) Independent institutions in New Jersey received \$1.90 per capita in state government support.

#### State Tax Base and Budget

New Jersey has above-average tax potential and had a tax capacity of \$1,078 per capita in 1981 (16th in the nation), 5 percent above the national average of \$1,030. The capacity was the result of above-average tax potential for selective sales, individual and corporate income, and residential and commercial property.

New Jersey's tax effort was 12 percent above national average rates, a state rank of 10th. The state collected \$1.3 billion more in property taxes because of above—average rates, \$323 million more in selective sales taxes, and \$229 million more in licenses. These additional collections were offset by \$526 million in potential revenue lost because of lower tax rates than average for general sales, and \$568 million lost because of below—average individual income taxes. As a result of the state's above—average capacity and effort, collected tax revenues of \$1,204 per capita were 17 percent above average, ranking New Jersey 7th in the nation in tax funds available to support public services.

New Jersey allocated 7.3 percent of its tax revenues to higher education, substantially below the 10.5 percent national rate. As a result of above-average tax revenues and a below-average allocation rate, appropriations of \$88 per capita for institutional support, student aid, and other support were 18 percent below the national average, ranking New Jersey 38th in the nation.

If the total operating and capital budget of New Jersey (including nontax and federal revenues) is considered, elementary/secondary education and public services received a larger share of the budget relative to national average allocations, and higher education, health and hospitals, and highways received a proportionately smaller share.

#### Higher Education Enrollments

Access for New Jersey residents was 6 percent below average in FY 82, with 32 residents per 1,000 population attending college somewhere. The national average was 34 residents per 1,000 population. Although more than twice as many residents enrolled at institutions in other states, almost 20 percent fewer attended public institutions in New Jersey. This created below-average access for residents.

The 56 colleges and universities in New Jersey enrolled 216,207 FTE students in fall 1981. The public system, consisting of 29 institutions, enrolled 162,675 (75 percent) of the students, making it a very small public system relative to the state's population. University enrollment, as a share of the public total, was proportionately smaller than nationally (20.8 versus 32.1 percent); four-year college enrollment was larger (37 versus 28.3 percent); and two-year college enrollment was slightly larger (38.2 versus 37.8 percent). The 27 independent institutions in the state enrolled 53,532 FTE students in fall 1981, a small private enterprise relative to the state's population.

In FY82, New Jersey had a larger number of high school graduates per 1,000 population than the national average, but only 482 percent entered state public institutions, below the national average of 62.5 percent. In-migration of nonresidents to attend public institutions in New Jersey

was only 20 percent of the national average rate. Retention or continuation of students at public institutions was at the national average, and full-time enrollments were slightly below average. In the independent sector, residents made up 76 percent of enrollment at New Jersey's private institutions, above the national level of 60 percent.

#### Institutional Finances and Characteristics

State and local appropriations were rather unevenly distributed among New Jersey's public institutions. Rutgers Un versity -- New Brunswick, a research university without medical, received appropriations per student at the national average. Rutgers University -- Newark Campus, classified as a university without medical, received appropriations 52 percent above the average (ranked 3rd out of 28 states). The state's seven comprehensive colleges received appropriations 26 percent below the national average. The nine two-year academic colleges received state funds 18 percent below average, and the seven two-year occupational colleges received appropriations 28 percent below average (ranked 38th out of 46 states). State funding for the health-professional college and the New Jersey Institute of Technology was substantially above average.

Tuition revenues at all public institutions were above average, particularly at the two-year academic schools and the health-professional college, thereby helping to offset low appropriations. However, the comprehensive and the two-year occupational colleges operated with total educational and general revenues 20 percent below average. Instructional expenditures per student at the various public institutions generally reflected the relative level of as, te appropriations. High appropriations for Rutgers University—Newark Campus translated into instructional expenditures 34 percent above average. Low appropriations for the two-year occupational colleges resulted in instructional expenditures 26 percent less than the national average for instruction.

Princeton University, one of the country's six independent research universities without medical programs, was funded at 8 percent above the average for this exclusive group of institutions. The four independent comprehensive colleges, with enrollments totaling 18,765 students, had nearly average total funding and a corresponding expenditure pattern.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	•	41,367,661
Postsecondary vocational-technical education	•	٥
State boards and commissions	•	4,270,494
Retirement benefits (including social security)	\$	74,495,691 (includes frings benefits)
Fringe benefits	1	0
Interstate contracts and reciprocity payments	•	0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	•	174,025
Centrally administered capital/debt service	•	0
Other	1	3,151,189

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 12,513,079A
- auxiliary enterprises \$ 0
- other \$ 0

Tuition and Fees reappropriated by the state? No answer provided

#### Other Connents

Source: HEGIS "State Expenditure for Postsecondary Education for Fiscal Years Ending in 1981 and 1982" Survey

 The fee revenue: for these expend tures are generated entirely by students and are not reported in MEGIS by the institutions

Data for two Dubino colleges were not included due to incomplete data sets. Union College is incorrectly classified as independent, but should be a public two-year academic school. Therefore, the analysis for the independent sector is somewhat distorted.

(Indexes shown in bold are based on U.S. average = 100)

## **NEW MEXICO**

#### Recont Trends

State funding for public higher education in New Mexico rose 14.4 percent in fiscal year 1982, sufficient to cover both inflation and a 3.2 percent growth in enrollments. However, tuition revenues increased more slowly than inflation, creating a net loss of 2.5 percent in total educational and general revenues per student in constant dollars. Because funding trends in the preceding years were more positive, the four-year fiscal pattern in New Mexico remained encouraging.

From 1978 to 1982, New Mexico increased appropriations to public institutions by 62.5 percent, an increase 10th highest in the nation. Enrollment growth of 7.9 percent and inflation of 44.3 percent (HEPI) reduced this increase in constant dollars per student to 4.3 percent. Nevertheless, this remains far better than the average 5.3 percent decline that public institutions experienced nationally. Tuition revenues failed to keep pace with inflation, losing 3.7 percent in purchasing power during the four years. However, large increases in revenues from other sources improved total educational and general revenues per student in constant dollars by 5.5 percent, the 9th-highest increase in the nation

Faculty salaries at public institutions increased 35 percent during the four years. However, inflation of 50.2 percent (CPI) resulted in a 10 percent loss in purchasing power.

Enrollment declined 13.4 percent from 1978 to 1982 at the three independent institutions in New Mexico. Tuition revenues increased 42 percent and, when adjusted for 44.3 percent (HEPI) inflation, showed a 13.2 percent increase in constant dollars per student, 6th highest in the nation. Total educational and general revenues per student in constant dollars increased 9.1 percent. Faculty salaries increased only 21 percent during the four years, representing a loss in purchasing power of 19 percent.

#### State Financing of Higher Education

New Mexico operates a larger than average public higher education system relative to its population and in FY82 enrolled 32.0 FTE students per 1,000 population, compared to the national average of 29.2 per 1,000 population. Total per capita appropriations for higher education of \$117.60 were 9 percent higher than average, ranking the state 15th. Thus, appropriations per student of \$3,674 were 10 percent above the national average, ranking the state 14th. High revenues from other sources improved public institutional total funding per student to 15 percent above average.

New Mexico did not appropriate any funds for student financial aid, whereas the U.S. average was \$4.20 per capita. Independent institutions in New Mexico received no state support.

#### State Tax Base and Budget

New Mexico had a tax capacity of \$1,170 per capita in 1981, 9th in the nation and 14 percent above average. This wealth is due principally to an extremely high severance-tax potential, 6.8 times the national average.

New Mexico's tax effort, however, was ll percent below national average rates, with a state rank of 32nd. When its rates are compared to national averages, the state lost \$136 million in potential individual income taxes and \$220 million in potential property taxes. This was counterbalanced by higher taxes on general sales than average, which produced an additional \$224 million. The combination of above-average capacity and below-average effort placed New Mexico at the national average, with collected tax revenues of \$1,042 per capita, ranking New Mexico 17th in the nation in tax funds available to support public services.

New Mexico allocated II.3 percent of its tax revenues to higher education, 8 percent above the national average. Given the state's average tax revenues, this allocation rate provided appropriations of \$117.60 per capita for institutional support, 9 percent above the national average, ranking New Mexico 15th in the nation.

If the total operating budget of New Mexico (including nontax and federal transfers) is considered, highways, elementary/secondary education, and higher education received a larger share of the budget relative to national average allocations, and public welfare received a proportionately smaller share.

#### Higher Education Enrollments

In FY82, New Mexico residents were 14 percent less likely to enroll in higher education than residents of other states. Twenty-nine residents per 1,000 population attended college somewhere, compared to the national average of 34 per 1,000. A relatively high proportion, 86 percent, attended public institutions within the state; 3 percent attended independent institutions in state; and 10 percent attended out-of-state institutions. The national average distribution was 73 percent, 18 percent, and 9 percent respectively. Thus, New Mexico's lower rate of access for its residents is related to the below-average number of residents at independent institutions in the state.

The 19 colleges and universities in New Mexico enrolled 45,113 FTE students in fall 1981. The public system, consisting of 16 institutions, enrolled 42,750 (95 percent) of the students, making it a larger enterprise than average relative to the state's population. University enrollment, as a share of the public total, was proportionately much larger than the national mix (66.4 versus 32.1 percent); comprehensive institution enrollment was smaller (18.7

versus 24.4 percent); and two-year college enrollment was much smaller (14.9 versus 37.8 percent). The three independent institutions in the state enrolled 2,363 FTE students in fall 1981. This represents a very small private enterprise relative to the state's population.

In FY\$2, New Mexico had 7 percent more than the national average number of high school g-aduates per 1,000 population. However, only 41.2 percent entered the state's public institutions, well below the national rate of 62.5 percent. In-migration of nonresident students per capita was 1.5 times the national average. Student retention was 33 percent above average, and full-time enrollments were above average. In the independent sector, residents made up 64 percent of enrollments.

#### Institutional Finances and Characteristics

The manner in which New Mexico divides up appropriations to its major public institutions is unusual. The four comprehensive colleges, enrolling 7,992 students, received appropriations per student 35 percent greater than the national average. New Mexico State University, a research university without medical programs, received appropriations at the national average. The University of New Mexico, a university with medical programs, received appropriations II percent below average. Tuition revenues at both universities were very low. However, New Mexico State University had a high level of private gifts and grants and revenues from other sources. This placed its total educational and general revenues per student near the national average. In addition to high appropriations, the four comprehensive colleges received a high level of private gifts and grants, nearly seven times the national average. Consequently, their total educational and general revenues per student were 36 perceot above average.

The eight two-year academic colleges in New Mexico received very favorable funding. State appropriations were 46 percent above average (ranking 5th out of 46 states), tuition revenues were 16 percent above average, and private gifts and grants were 49 times the national average. These colleges thus secured total educational and general revenues per student that were 86 percent above the national average, leading to a correspondingly high expenditure pattern.

Expenditures for instruction per student at New Mexico State University and the University of New Mexico were 21 and 31 percent below average, respectively. This was a direct consequence of both low appropriations and low tuition.

New Mexico's three small independent baccalaureate colleges were funded at 32 percent below the national average. However, they received an above-average level of government contracts per faculty member.

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the MEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	•
Postsecondary vocational-technical education	
State boards and commissions	•
Retirement benefits (including social security)	\$
Fringe benefits	•
Interstate contracts and reciprocity payments	
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	•
Cantrally administered capital/debt service	
Other	

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences impractices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees - auxiliary enterprises - other

Tuition and fees reappropriated by the state?

Other Comments

### **NEW YORK**

#### Recent Trends

New York was one of a relatively small number of states that experienced real-dollar improvements in funding for higher education in FY1982. The 14.1 percent jump in state support was sufficient to accommodate inflation and enrollment gains, netting a 2.6 percent improvement in the purchasing power of its state institutions. New York ranked 11th in the nation in real-dollar funding gains and was therefore among the 16 states that had any gains that year. Improvements in overall funding were evident in six of the nine sectors. The improvements in constant-dollar funding in FY82 came on the heels of two years of reduced revenues. As a result, the profile for the state between 1978 and 1982 shows a funding decline of 1.5 percent overall in constant dollars per student, even though state support was slightly better than level after adjustment for inflation and enrollment growth.

The loss in purchasing power for total revenues is largely attributable to the failure of tuition gains to keep pace with inflation and enrollments. Between 1978 and 1982, tuition revenues in New York's public sector shrank by 14.0 percent in constant dollars. Only three other states (North Carolina, Oklahoma, and Hawaii) had greater decreases in the value of tuition collections.

By category of institution, the profile is quite mixed. Only four sectors made gains against inflation, including the nonmedical research university (gaining 15.6 percent per student), the comprehensive sector (5.6 percent), the health-professional sector (2.6 percent), and other professional schools (7.7 percent). All other sectors of public institutions saw their funds eroded at rates between 3.5 and 17.6 percent.

#### State Financing of Higher Education

In 1982, New York spent \$2.1 billion on higher education, which in per capita terms was 12 percent above the national average. Moreover, New York provides more financial support to the independent sector (\$13 percapita—four times the national average) than does any other state. In total, 11 percent of the state's higher education budget is channeled to the private sector. The national average is 3 percent. New York also provides more student aid (\$16.80 per capita) than does any other state except Alaska.

#### State Tax Base and Budget

New York has 11 percent less taxable wealth than the typical state, ranking it 36th in tax capacity. However, by levying the second-highest tax rate in the nation (71 percent above average), the state overcomes its below-average wealth and raises more tax revenues than does any other state except Alaska, the District of Columbia, and Wyoming. New York has above-average tax capacity in two of the ten tax categories -- individual income and death and gift transfers. The state makes a below-average tax effort in three relatively minor categories, death and gift taxes, licenses, and severance, and the capacity of the latter two is inherently low anyway. New York leads the nation in corporate income tax rates (index 235) and in overall property tax (index 203), and it is 3rd in tax rates for individual income. The state also levies substantial taxes on general and selective sales (indexes 141 and 110 respectively).

The net effect of these tax rates is that the state collects \$1,567 per capita in tax revenues, exceeding by \$651 its tax capacity of \$916. This massive tax program enables the state to collect 52 percent more in revenues than average tax rates could yield.

Census data for 1982 show that New York's operating budget, including federal revenue-sharing funds, is 38 percent greater than average. However, only three functions receive above-average shares of this large budget: public welfare, health and hospitals, and other. New York spends 1.0 percent of its budget on public welfare, 32 percent more than the national average. Higher education gets one of the smallest shares of the budget (only 5.9 percent), 39 percent below the national average share. This share improved only slightly from 1978, from 5.7 to 5.9 percent.

#### Higher Education Enrollments

New York residents are 19 percent more likely to enroll in higher education than average. Ranking 3rd nationally, New York attains this level of enrollment because its rate of attendance at independent institutions—15 per 1,000 population—is more than two and a half times the national rate. Only Massachusetts exceeds this rate. Enrollment at public institutions in the state is about 10 percent below average, and an above—average number go out of state (index 110).

Not only is resident enrollment below average at the state's public institutions, but these institutions in New York draw only one-quarter as many nonresidents as is average. As a result, enrollment in the public sector is 18 percent below

average, although above-average rates of persistence and full-time study compensate to some degree. Public institutions enroll 24 FTE students per 1,000 population, compared to the U.S. average of 29 per 1,000.

New York provides much less emphasis on university studies and significantly more emphasis on study at two-year institutions than average in the public sector. In addition, its comprehensive sector is larger than usual. The portion of students enrolled in universities is half the usual share, creating a relatively less expensive system of higher education to support. By contrast, the independent sector is more university and comprehensive oriented and is therefore a more costly mix.

#### Institutional Finances and Characteristics

State support to public institutions in New York is 1 percent below average, and enrollment levels are even lower (18 percent below average). As a result, appropriations per student in New York are 21 percent above average, with all sectors funded at rates close to or substantially above average. Tuition revenues are also substantially higher than average, by 20 percent, thus creating a significant base of support for the public sector. In total, all public sectors except the public health-professional (index \$4) and specialized institutions (index 97) are funded at levels substantially above average (ranging from 21 to \$5 percent), despite the fact that government grants and contracts, private gifts, and other B&G funding are markedly below average (by 20 to 36 percent).

Independent institutions in New York are also generally well funded by national standards, largely as a consequence of substantial tuition revenues and strong endowment income. Unlike public institutions in New York, private institutions have been very successful in securing government grants and contracts. These schools receive 44 percent more per faculty member than do average U.S. independents.

Faculty salary increases in New York's public and independent sectors kept pace with national trends from 1978 to 1982. Overall, salaries in the public sector in New York are 9 percent above average, while those at independent institutions are 8 percent above average for that category.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutione through the MEGIS inetitutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	8293,000,000 (estimate)
Postsecondary vocational-technical education	8 0
State boards and commissions	8 16,000,000
Retirement benefits (including endial security)	0
fringe benefits	• •
Interetate contracte and reciprocity payments	€ · \.0
Service functions provided centrally (e.g., conputer eervice, library, telephone, etc.)	6 unable to astinate
Centrally administered capital/debt service	8 0
Other	8 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the MEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 76,500,000 appropriations to public institutions in the state

Current funds revenues dedicated to capital purposes:

- tuition and fees \$ 0
   auxiliary enterprises \$ 0
   other \$ 0
- Tuition and Fees reappropriated by the state? No answer provided

## NORTH CAROLINA

#### Recent Trends

State appropriations to North Carolina's public institutions increased 60 4 percent from 1978 to 1982, the 12th-highest increase in the nation. However, the state also experienced an 113 percent growth in enrollments, a very high rate compared to the national average of 5 6 percent. When inflation of 44.3 percent (HEPI) is also taken into account, appropriations in constant dollars per student fell. I percent during the four-year period. Tuition revenues failed to keep pace with inflation, falling 18.4 percent per student in constant dollars, the 3rd-greatest loss in the country. However, revenues from other sources substantially increased. As a result, the loss in total educational and general revenues per studen, in constant dollars was contained to only 10 percent between 1978 and 1982 Faculty salar es at public institutions increased 42 percent. When inflation is taken into account, this resulted in a 5 percent loss in purchasing power

The state's 50 independent institutions also experienced strong enrollment growth during the four years, 111 percent compared to the U.S. average of 10.6 percent. Tuition revenues generally failed to keep pace with inflation, declining 2.6 percent per student in constant dollars. Revenues from other sources did not remedy the situation. As a result, total educational and general revenues per student in constant dollars declined 3.9 percent. Faculty salaries in the independent sector increased only 3.2 percent over the four years, creating 2.12 percent loss in purchasing power.

#### State Financing of Higher Education

North varolina's public higher education system is above average in size relative to its population and in FY82 enrolled 311 FTE students per 1,000, population compared to the national average of 29.2 students per 1,000 population. Per capita appropriations for higher education of \$116.10 were 8 percent above average. As a result, appropriations were \$3.725 per student, 12 percent above average and ranking the state lith in the nation. Low tuition revenues reduced total institutional funding per student to 3 percent above average.

#### State Tax Base and Budget

North Carolina's low tax potential of \$819 per capita, 46th in the nation, was 20 percent below the national average of \$1,930. This condition was the result of below-average tax capacity for general sales, individual income, and residential, commercial, and farm property.

The state's tax effort was 5 percent below the national average, ranking it 23rd. By taxing individual income 54 percent above the national average, North Carolina secured an additional \$458 million. However, by taxing property at a rate 27 percent below the national average, the state lost \$420 million in potential revenues. Lower tax rates for general sales resulted in a \$259 million loss. This low tax capacity and below-average effort produced tax revenues of \$780 per capita, 24 percent below the national average, and placed North Carolina 40th in the nation in tax funds available to support rublic services.

North Carolina allocated an exceptionally high 14.9 percent of its tax revenues to higher education, well above the national rate of 10.5 percent. This high allocation rate produced appropriations of \$1.16 per capita for institutional support and student aid, 8 percent above the national average, ranking North Carolina 19th in the nation.

If the total operating budget of North Carolina (including nontax and federal transfers) is considered, higher education, elementary/secondary education, and health and hospitals received a larger share of the budget relative to national average allocations. Highways, public welfare, and public services received a proportionately smaller share Moreover, higher education improved its budget share between 1978 and 1982 from 13.5 to 14.4 percent

#### Higher Education Enrollments

In FY82, North Carolina had 34 residents per 1,000 population attending college somewhere, equal to the national average. A relatively high proportion, 79 percent, attended public institutions within the state, 18 percent attended independent institutions in state, and only 3 percent attended out-of-state institutions. The national distribution was 73 percent, 18 percent, and 9 percent respectively

The 124 colleges and universities in North Carolina enrolled 240,527 FTE students in fall 1981. The public system, consisting of 74 institutions, enrolled 184,914 (77 percent) of the students, making it a larger enterprise than average relative to the state's population. University enrollment, as a share of the public total, was proportionately smaller than the national mix (25.5 versus 32.1 percent), four-year college enrollment was larger (32.5 versus 28.3 percent); and two-year college enrollment also was larger (42.0 versus 37.8 percent). The 50 independent institutions in the state enrolled 55,613 FTE students in fall 1981, representing an average-size private enterprise relative to the state's population.

In FY82, North Carolina had a lower number of high school graduates per 1,000 population than the national average. However, 69.2 percent entered state public institutions, above the national entrance rate of 62.5 percent. In -migration of nonresident students per capita was 4 percent above the national average. Student retention was 8 percent below average, and full-time enrollments were above average. In the independent sector, residents made up 63 percent of enrollments at North Carolina's private institutions, above the national level of 60 percent.

#### Institutional Finances and Characteristics

North Carolina's appropriations were above average for its public institutions with the exception of the nonmedical university (University of North Carolina -- Greensboro), which received average funding from the state. The medical research university (University of North Carolina -- Chapel Hill) received appropriations 33 percent above the national average (ranking 4th among 28 states); the nonmedical research university (North Carolina State University -- Raleigh) received funds 45 percent above average (ranking 3rd among 17 states). However, tuition revenues were substantially below average at all public institutions. Nevertheless, public institutions in the state generally received above-average total educational and general revenues (excluding government contracts) per student. The exceptions were the University of North Carolina -- Greensboro and the state's 48 two-year occupational colleges, which were funded at 14 percent and 5 percent below average, respectively.

Instructional expenditures per student were above average for all public institutious, particularly the University of North Carolina -- Chapel Hill, where the level was 58 percent above average. Aithough varying by institutional sector, full-time faculty salaries in the public sector were 5 percent below the national average

The state's 50 independent institutions were generally well funded, with one notable exception—Duke University. Duke received relatively low tuition revenues, perhaps resulting from an effort to remain competitive with the state's public sector. As a result, Duke's total educational and general revenues (excluding government contracts) per student were 30 percent below average. We should point out, however, that Duke is classified as an independent research university with medical programs, a very exclusive category that includes only 12 institutions in the country. Duke's instructional expenditures per student and academic support per faculty member were about 20 percent below average.

#### **Data Notes**

1981-82

Additional State and total Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the MEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Covernment Supports of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per Capita terms.)

"tudent Aid	\$ 18,500,000 4
Postsecundary vocational-technical education	4
State boards and commissions	•
Retirement benefith (including social security)	6
fringe benefits	4
Interstate contracts and reciprocity payments	1
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	\$
Centrally administered capital/debt service	<b>s</b>
Other (for instate students attending medical programs at independent institutions)	\$ 2,000,000*

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

De.t service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

tuition and fees
- auxiliary enterprises
- other

Tuition and fees reappropriated by the state?

#### Other Consent

In North Carolina funding for vocational-technical schools are included in higher education.

In FYR?, North Carolina Stat: University - Raleigh (research university without medical) received funding for its school of veterinally medicine. However, this institution has not been classified as a medical institution in this document since it did not award degrees in this program in FYR?

Source: University of North Carolina - General Administrationation

(Indexes shown in bold are based on U.S. average = 100)

^{*} These data were submitted after the analyses were completed and therefore are not included in the analyses.

### NORTH DAKOTA

#### Recent Trends

Between 1978 and 1982, North Dakota increased its appropriations for public higher education by 77.4 percent, the 4th-highest increase in the country. This more than compensated for a 6.7 percent enrollment growth and a 44.3 percent (HEPD) inflation rate, allowing the state to register a sizable 15.2 percent gain in appropriations per student in constant dollars. Tuition revenues also surpassed inflation, resulting in a 4.9 percent gain per student in constant dollars. Thus, North Dakota's public institutions received an 11.8 percent increase in total educationa, and general revenues per student in constant dollars, 4th highest in the nation. During this period, faculty salaries increased 45 percent. This was insufficient to cover the 50.2 percent increase in the CPI, the result being a 5 percent loss in faculty purchasing power.

The cour independent institutions in the state experienced massive enrollment growth of 25.7 percent between 1978 and 1982. During the same period, tuition revenues per student rose 52 percent, a remarkable 10.0 percent increase in constant dollars. With revenues from other sources keeping pace, total educational and general revenues per student in constant dollars improved 10.8 percent. A 36 percent increase in faculty salaries over the four-year period resulted in a 9 percent loss in purchasing power.

#### State Financing of Higher Education

Relative to its population, North Dakota operated the 2nd-largest public higher education system in the country and in FY82 enrolled 441 FTE students per 1,000 population. Il percent above the national average of 292 students per 1,000 population. Total appropriations of \$155 50 per capita for higher education were also very high, 42 percent above average. Thus, state appropriations of 112 per student were 3 percent above the national aver. ranking the state 21st. High revenues from private 2018 and grants and other sources raised total institutional revenues per student to 6 percent above average.

North Dakota appropriated \$11 million for interstate contracts and reciprocity payments, \$566,000 for state boards and coordinations, and \$462,000 for student aid independent institutions it. North Dakota received no state government support.

#### State Tax Base and Budget

North Dakota's potential tax wealth improved dramatically in 1980 the state clinked 14th in the nation, with a capacity 3 percent above average, in 1981 the state ranked 6th, with a capacity 24 percent above average. In 1981, North Dakota had the potential to raise \$1,271 per capita in taxes; the national average was \$1,030. This improvement was due to a severance-tax potentis that increased from 2.5 to 4.7 times the national average between 1980 and 1981 North Dakota also had above-average tax potential for general sales, licenses, corporate income, and farm property.

North Dakota's tax effort was 26 percent below the national average, with a state rank of 45th. The state undertaxed general sales, creating a loss of potential revenue of \$5.7 million, individual income, creating a potential loss of \$5.3 million, and property, creating a potential loss of \$6.4 million. The low effort offset high capacity and resulted in collected tax revenues of \$9.41 per capita, 9 percent below average. This placed North Dakota 2.7th in the nation in tax funds available to support public services.

North Dakota allocated 16.3 percent of its tax revenues to higher education, 2nd-highest in the country and well above the national average rate of 10.5 percent. As a result, per capita appropriations of \$153.50 for institutional support, student aid, and other support were 42 percent above the national average, ranking North Dakota 4th in the nation.

If the total operating budget of North Dakota (including nontax and federal transfers) is considered, higher education, highways, and other received a larger share of the budget relative to the national average. Public welfare, health and hospitals, and public services received a proportionately smaller share.

#### Higher Education Enrollments

In FY82, North Dakota had 40 residents per 1,000 population attending college somewhere, a level 19 percent above the nationa, average of 34 students per 1,000 population. A very high proportion, 85 percent, attended public institutions within the state, only 6 percent attended independent institutions in state, and 8 percent attended out-of-state institutions. The national distribution was 73 percent, 18 percent, and 9 percent respectively. Above-average attendance by residents at state public institutions and account in other states creates the state's high level of access.

The 15 colleges and universities in North Dakota enrolled 30, 273 FTE students in fall 1981. The public system, consisting of II institutions, enrolled 2.3, 119 (9.4 percent) students. Relative to the state's population, the public system was an extremely large enterprise, ranking 2nd i...

the nation. University enrollment, as a share of the public total, was near the national level (31.1 versus 32.1 percent). Four-year college enrollment was much larger (45.9 versus 28.3 percent), and two-year college enrollment was much smaller (22.9 versus 37.8 percent). The four independent institutions in the state enrolled 1,854 FTE students in fall 1981, a very small enterprise relative to the state's population.

In FY82, North Dakota had more high school graduates per 1,000 population than the national average. Moreover, 6°0 percent entered state public institutions, above the corresponding national entrance rate of 62.5 percent. In-migration of nonresident students per capita was 3.4 times the national average. Student retention was below average, while full-time enrollments were above avera;... In the independent sector, residents made up 59 percent of enrollments.

#### Institutional Finances and Characteristics

North Dakota State University appears to be the most favored of the state's public institutions in terms of financial support. Enrolling 8,454 students, it received appropriations per student 30 percent above average for comprehensive institutions. On the other hand, the University of North Dakota, enrolling 9,069 students, received appropriations only 5 percent above average for universities with medical programs. Both types of institutions received below-average tuition revenues but above-average revenues from gifts, grants, and other sources. As a result, total educational and general revenues per student were 47 percent above average for the comprehensives and 1 percent below average at the University of North Dakota Yet, in an unusual turnabout, North Dakota State University, which emphasizes research and public service, spent 22 percent less than average for instruction, whereas the University of North Dakota spent 23 percent more

The state's four baccalaureate colleges and two two-year occupational schools received appropriations 9 percent above average. The three two-year academic colleges were funded at 18 percent below average per stude it.

The state's public institutions generally received lower tuition revenues than average. This was not the case at the state's academic two-year institutions. Their tuition revenues were 34 percent above average, evidently to counterbalance their low share of state support.

The four independent institutions in the state were generally underfinanced

### OHIO

#### Recent Trends

State and local appropriations to public higher education increased only 29.3 percent in Ohio between 1978 and 1982, substantially less than the U.S. average of 44.2 percent During the same period, enrollment grew by 7.1 percent, significantly above the U.S. average of 5.6 percent. Thus, when inflation of 443 percent (HEPI) is taken into account, appropriations per student in constant dollars declined 16.3 percent, well below the national average of 5.3 percent and ranking the state 44th. Tuition revenues at public institutions did, however, keep pace with inflation, increasing 91 percent per student in constant dollars. As a result, total educational and general revenues per student in constant lollars fell 4 % percent. The purchasing power of state and total funding declined in fiscal years 1980, 1981. and 1982. Faculty salaries in the public sector increased 36 percent during the four years. This was substantially less than the 502 percent increase in the CP1 and resulted in a 9 percent loss in purchasing power.

The 73 independent institutions in Ohio experienced the 7th-largest enrollment growth in the country from 1978 to 1982, 196 percent. These institutions generally failed to raise tuition to match inflation, resulting in an 80 percent revenue loss per student in constant dollars. Also, revenues from other sources did not match enrollment growth and inflation. Thus, Ohio's private institutions suffered a severe 101 percent decline in total educational and general revenues per student in constant dollars, the 2nd-worst loss in the country. Faculty salaries increased 35 percent, creating a net loss in purchasing power of 10 percent.

#### State Financing of Higher Education

Ohio operates a smaller than average public higher education system and in FY82 enrolled 26.5 FTE students per 1,000 population, compared to the national average of 29.2 students per 1,000 population. However, total per capita appropriations of \$68.80 for higher education were 36 percent below average, ranking the state 46th. Consequently, appropriations of \$2,423 per student were 27 percent below average, ranking Ohio 49th in the nation The state received tuition revenues that were 73 percent above average. Together with high revenues from other sources, this brought total educational and general revenues per student to 2 percent below average.

Ohio appropriated \$3.60 per capita for student financial aid (ranked 16th), compared to the national average of \$4.20 per capita. The state appropriated \$4.3 million for state boards and commissions. Independent institutions in Ohio received \$7.0 per capita in state government support.

#### State Tax Base and Budget

Ohio's tax capacity of \$972 per capita in 1981 was 6 percent below the national average, ranking the state 29th The state has a nearly average capacity for each of the major types of taxes.

Ohio's tax effort was li percent below the national average, with a state rank of 33rd. The state taxed general sales at 24 percent below national average rates, thereby losing \$574 million is potential revenue. Corporate income was undertaxed, creating a potential loss of \$202 million; undertaxing of individual income represented a potential loss of \$134 million; and undertaxing of property represented a potential loss of \$312 million. As a result of the low effort, collected tax revenues of \$862 per capita were 16 percent below average, ranking Ohio 36th in the nation in tax funds available to support public services.

Ohio allocated 8 percent of its tax revenues to higher education, substantially below the national average rate of 10.5 percent. Due to low allocations and low collected revenues, appropriations of \$68.80 per capita for institutional support, student aid, and other support were 36 percent below the national average, ranking Ohio 46th in the nation.

If the total operating budget of Ohio (including nontax and tederal revenues) is considered, elementary/secondary education, public welfare, health and hospitals, and public services received a slightly larger share of the budget relative to national average allocations. Highways, higher education, and other functions received a proportionately smaller share. Higher education's share of the state budget remained stable between 1978 and 1982.

#### Higher Education Enrollments

In FY82, Ohio had 32 residents per 1,000 population attending college somewhere, below the national average of 34 residents per 1,000. Residents enrolled at public institutions in the state at a rate 4 percent below average, although large numbers enrolled at private institutions in Ohio. About one—third fewer residents go out of state for higher education than is typical.

The 132 colleges and universities in Ohio enrolled 385,732 FTF students in fall 1981. The public system, consisting of 59 institutions, enrolled 285,690 (74 percent) of the students, making it a smaller enterprise than average relative to the state's population. University enrollment, as a share of the public total, was proportionately much larger than the national level (63 versus 321 percent). Four-year college enrollment was very much smaller in relative size (104 versus 283 percent), as was two-year college enrollment (263 versus 378 percent). The 73 independent institutions in the state enrolled 100,042 FTE students in fall 1981, an average-size private enterprise relative to the state's population.

In FY82, Ohio had an above-average number of high school graduates per 1,000 population compared to the nation, but only 48.5 percent entered state public institutions, below the national average of 62.5 percent In-migration of nonresident students per capita vas 36 percent below the national average. Student retention at

public institutions was average, and full-time enrollments were slightly above average. In the independent sector, residents made up 67 percent of enrollments at Ohio's private institutions, above the national average of 60 percent.

#### Institutional Finances and Characteristics

The state of Ohio consistently and uniformly underfunded its public institutions of higher education as judged by national averages. Ohio State University and the University of Cincinnati, research universities with medical programs, received appropriations per student 31 percent below average (ranked 25th out of 28 states). Appropriations to the University of Ohio (university with medical program) and the universities without medical programs were 36 percent below average. The state's 14 two-year academic colleges were the best-supported institutions, yet received funding 15 percent below average. All of the public institutions attempted to make up for low appropriations with high tuition, but only three categories of institutions were successful. The state's comprehensive colleges received tuition revenues 62 percent higher than average (highest in the nation for this type of institution), plus substantial private gifts and grants (double the national average). This brought their total educational and general revenues per student up to the national average. The state's two-year academic colleges also succeeded in meeting the national average, by charging tuition nearly twice the national average. The health-professional institutions were the best funded, with total educational and general revenues 12 percent above average.

Instructional expenditures per student were below average at all of the public institutions in the state with the exception of the health-professional schools. Research expenditures per faculty member at the University of Cincinnati and Ohio State University were underfunded by 55 percent in comparison to national averages. However, public service was funded at 67 percent above average

Ohio's 73 independent institutions generally charged less tuition than average and were underfinanced overall. The 30 general baccalaureate colleges were exceptions. They received tuition revenues 22 percent above average and had total educational and general revenues per student that were 14 percent above average. They were the only type of independent institution in the state with an above-average expenditure pattern.

## **OKLAHOMA**

#### Rocent Trends

Oklahoma led the nation in improving funding for state-operated institutions between 1978 and 1982. Appropriations increased \$6.4 percent, almost twice the national average. Enrollments remained essentially constant. Consequently, appropriations per student in constant dollars increased 28.8 percent, a level that was unsurpassed in the nation. Public institutions in Oklahoma failed to increase tuition revenues to offset inflation, resulting in a 19.4 percent reduction per student in constant dollars; the national average was a 1.4 percent gain. This moderated the gain achieved through appropriations, but total educational and general revenues per student in constant dollars still increased 17.6 percent, more than in any other state. All categories of public institutions achieved real-dollar improvements in their operating revenues. Faculty salaries at public institutions during the four years increased 47 percent, the 3rd-highest increase in the nation and nearly enough to match the 50.2 percent increase in the CPL

The 15 independent institutions in the state grew by only 1.7 percent, whereas the national average incollment growth for private colleges was 10.6 percent. The private sector substantially increased tuition revenues, by 7.4 percent, resulting in an 18.7 percent gain per student in constant dollars. Revenues from other sources also rose. Consequently, total educational and general revenues per student in constant dollars increase 21.3 percent, an increase 3rd highest in the nation.

#### State Financing of Higher Education

Relative to its population, Oklahoma operates a larger than average public higher education system and enrolled 32.0 FTE students per 1,000 population in FY82, compared to the national average of 29.2 students per 1,000 population. Total appropriations of \$103.20 per capita for higher education were 4 percent less than average. Thus, appropriations of \$3,222 per student were 3 percent below average, ranking the state 24th. Institutions in the state received tuition revenues that were 44 percent below average, as well as low revenues from other sources. As a result, total revenues per student were 16 percent below average.

Oklahoma appropriated no funds for student financial aid; the U.S. average appropriation for student aid was \$4.20 per capita. Independent institutions in Oklahoma received no state government support.

#### State Tax Base and Budget

Oklahoma is a potentially tax-rich state and in 1981 had a tax capacity of \$1,311 per capita, 27 percent above the national average of \$1,030. The state had above-average capacity in selective sales, corporate income, and farm property. The state had a severance-tax potential 5 24 times the national average, with potential revenues of \$525 million had national average tax rates been applied. 384

Oklahoma's tax effort was 27 percent below the national average, one of the lowest in the nation, ranking the state 48th. When its rates are compared to national averages, the state lost \$105 million in potential general sales taxes, \$12\$ million in potential taxes on individual income, \$197 million in potential taxes on corporate income, and \$735 million in potential taxes on property. This unusual combination of very high capacity and very low effort resulted in collected tax revenues of \$952 per capita, 8 percent below the national average, ranking Oklahoma 25th in the nation in tax funds available to support public services. This was still an improvement over 1980, when state tax revenues were 17 percent below the national average, ranking the state 35th.

In 1982, Oklahoma allocated 10.8 percent of its tax revenues to higher education. This average rate of funding, combined with the state's low tax revenues, resulted in appropriations of \$103.20 per capita, 4 percent below the national average, ranking Oklahoma 25th in the nation. In 1981, state support of higher education per capita was 12 percent below average.

If the total operating budget of Oklahoma (including nontax and federal transfers) is considered, higher education and highways received a larger share of the budget relative to national average allocations; public services and other programs received a proportionately smaller share. Higher education increased its share of the state budget between 1978 and 1982 from 12.7 to 13.6 percent.

#### **Higher Education Enrollments**

In FY82, Oklahoma had 33 residents per 1,000 population attending college somewhere, slightly below the national average of 34 residents per 1,000 population. An above-average number of residents attended the state's public institutions. By contrast, residents were half as likely to attend an independent institution in the state or go out of state for advanced education.

The 44 colleges and universities in Oklahoma enrolled 117,998 FTB students in fall 1981. The public system, consisting of 29 institutions, enrolled 99,486 (84 percent) of the student—making it a larger enterprise than average relative to the state's population. University enrollment, as a share of the public total, war proportionately larger than nationally (39.0 versus 32.1 percent). Four-year college enrollment was smaller in relative size (26.3 versus 28.3 percent), as was two-year college enrollment (27.8 versus 37.8 percent). The 15 independent institutions in the state enrolled 18,512 FTB students in fall 1981, a small enterprise relative to the state's population.

In FY82, Oklahoma had an average number of high school graduates per 1,000 population compared to other states. A high proportion, 67.3 percent, entered state public institutions, above the national rate of 62.5 percent. In-migration of nonresident students per capita was 19

percent above the national average. In addition, student retention and full-time enrollments were also above average. In the independent sector, residents made up 52 percent of enrollments at Oklahoma's private institutions, below the national level of 60 percent.

#### Institutional Finances and Characteristics

Oklahoma State University enrolled 20,668 FTB students in fall 1981, while the University of Oklahoma -- Norman enrolled 18,135 students. Both institutions received low tuition revenues, but the similarity stops there. Compared to other universities without medical programs, the University of Oklahoma had much more favorable financing. Although state appropriations were at the national average, below-average tuition revenues meant that the university functioned with 10 percent less operating revenues than the national average. Consequently, expenditures for instruction, academic support, and faculty salaries were near the national average. On the other hand, appropriations at Oklahoma State, classified as a research university with medical programs, were 28 percent below average. Lacking large compensatory revenues from other sources, Oklahoma State's total educational and general revenues per student remained 39 percent below average, the lowest total funding per student in the country for this type of institution. Expenditures for instruction were 46 percent below average and for academic support were 80 percent below average. Faculty salaries were 13 percent below average.

The state's four comprehensive colleges, enrolling 18,335 students, also endured low appropriations and low tuition revenue. Their total educational and general revenues per student of \$2,890 were the lowest in the country.

Oklahoma's 14 two-year academic colleges, enrolling 26,290 students, fared much better. They received appropriations that were 9 percent above average and secured total educational and general revenues that were only 4 percent below average.

In sum, despite significant advances in state funding for public higher education in Oklahoma in recent years, below-average revenues from other sources, principally tuition, has meant continued below-average funding for most categories of public institutions. Between 1978 and 1982, the share of operating revenues contributed by the state rose from 60 to 70 percent. Contributions from tuition declined from 15 to 12 percent.

The 15 independent institutions in the state generally charges low tuition but were well financed because of large revenues from private gifts and grants and from endowment income. With total educational and general revenues per student of \$7,6\$0, the state's three independent comprehensive colleges ranked 5th in the nation. The two two-year academic colleges ranked 7th, with educational and general revenues of \$5,567.

### **Data Notes**

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the REGIS institutional

finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	
Postsecondary vocational technical education	
State boards and commissions	•
Retirement benefits (including social security)	
fringe benefits	•
Interstate contracts and reciprocity payments	
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	•
Centrally administered capital/debt service	
Other	

Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

. tuition and fess - auxiliary enterprises

Tuition and Fees reappropriated by the state?

Other Comments

Source: No data notes were supplied by the state higher education agency/commission.

## **OREGON**

#### Recent Trends

In fiscal year 1982, Oregon rebounded from the losses of the previous year and achieved a 3.3 percent net gain in funding, after accounting for inflation and enrollment shifts. Although this absolute gain is small, by national standards it was significant. Oregon ranked 6th in the nation in FY82 in constant-dollar funding improvements, a profile that contrasted markedly with the 2.0 percent decline generally felt in the states. Real-dollar gains in both state appropriations and tuition sparked this overall improvement in revenues. All but two sectors participated in these gains. The academic/comprehensive two-year sector was unable to accommodate both inflation and a very large enrollment increase, with the consequence that its overall purchasing power fell 16.6 percent. Funding of the other-professional sector (Oregon Institute of Technology) also lost ground to inflation and enrollments, with constant-dollar revenues shrinking 5.0 percent per student in FY82

For 1978 to 1982, the profile was not so positive. Despite an 185 percent increase in constant-dollar tuition revenues, the 8 6 percent decline in adjusted state appropriations created a net decline in purchasing power of 2.2 percent, a pattern that mirrored national trends. All but three sectors were impacted -- the health-professional school (the University of Oregon Health Sciences Center) had constant-dollar gains of 14.1 percent, the occupational two-year institutions showed constant-dollar gains of 4.8 percent, and the two universities without medical, Portland State and the University of Oregon, had a combined constant-dollar gain of 2.4 percent. The Oregon Institute of Techonlogy had the worst setback, with revenue losses in constant dollars per student of 23.1 percent, followed by the academic/comprehensive two-year schools (with losses of 190 percent) and the research university without medical (Oregon State University which had losses of 12.2

#### State Financing of Higher Education

In fiscal year 1982, Oregon spent \$116 per capita for higher education, a rate \$ percent above average. This resulted because the share of state tax revenues allocated to higher education was \$ percent larger than average. Most of these funds go directly to public institutions in the form of general institutional support, and a very small amount goes to the private institutions. The remaining 3 percent is allocated to interstate contracts and reciprocity payments, centralized library services, public broadcasting, and support of the state's coordinating commission

#### State Tax Base and Budget

Oregon is slightly below average in its capacity to raise tax funds, ranking 23rd among the states. Economic activity in four of the ten tax categories is above average, and Oregon is particularly strong in general sales taxes, licenses, and residential and farm property. Its rate of taxation is 1 percent above average. Its tax structure is unusual, with the state having the highest individual income taxes in the nation and no general sales taxes. Oregon's tax revenues are equal to the national average (index 100).

Higher education receives a large share of the state's budget, even though this share fell noticeably (from I1.6 to 10.3 percent) between 1978 and 1982. By contrast, public welfare and health and hospitals are low priorities and receive below-average shares of the state's budget. All other functions are funded at or above the average.

#### Higher Education Enrollments

The budget priority accorded higher education in Oregon is reflected in the state's high rates of enrollment. Residents of this state are 13 percent more likely to enroll in higher education than average, and only eight other states have higher rates of participation. This high degree of access is achieved through the state's public system of higher education, which enrolls 31 percent more residents than is generally the case. First-time enrollment of residents is 65 percent above the average. In addition, Oregon's public institutions attract a large number of out-of-state students (index 142).

Higher education in Oregon is distinctly public in nature, with 86 percent of all students enrolled at public institutions. The private sector in the state is about 40 percent smaller than average.

The two-year sector in Oregon enrolls an unusually large proportion of public students, 44 percent. The comprehensive sector (Western Oregon State and Southern Oregon State), by contrast, is much smaller than average. Given the greater emphasis on two-year institutions and the lesser focus on graduate enrollment, Oregon's public system of education is somewhat less expensive to operate.

#### Institutional Finances and Characteristics

Although Oregon provides substantial tax support per capita for higher education, high levels of enrollment in the public sector cause state funding per student to fall somewhat below the U.S. average. This is especially true for the universities, comprehensive institutions, and Oregon Institute of Technology, which receive state funds that are 16 to 29 percent below average. By contrast, the baccalaureate institutica (Bastern Oregon State) and the academic/comprehensive two-year campuses were funded by the state at levels 22 and 41 percent above average, respectively. The large two-year occupational sector receives 9 percent more from the state than average.

Tuition revenues are 22 percent above average overall, though revenues from other sources (except private sources and government grants and contracts) are below average. As a result, total revenues per student (excluding grants and contracts) were \$4,893 in 1982, a level matching the U.S. average. However, revenue profiles of the different groups of institutions were very uneven. The academic/comprehensive two-year colleges were most successful in garnering resources, collecting 42 percent more funds per student than average. The baccalaureate schools, occupational two-year institutions, and the health-professional institution also function with above-average funding (by 22, 11, and 6 percent respectively). The nonmedical universities (University of Oregon and Portland State University) and the Oregon Institute of Technology were the least successful in obtaining revenues and so function with 17 and 30 percent, respectively, less funding than average for these categories. In addition, Oregon State (index 91) and the two comprehensive institutions (index \$9) operate with below-average support.

Faculty salaries increased by only 27 percent between 1978 and 1982, which compared poorly with the 36 percent gain nationally. These losses put faculty salaries in Oregon's public system at a level 8 percent below the national average.

### **Data Notes**

981-82

- Additional State and Local Gevernment Funding for Higher Education 🥆 Current Operations

Only state and local funds not reported by the institutions through the MEGIS institutional finance report are sheun here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid		0
Postsecondary vocational technical education	•	0
State boards and commissions	•	8,837,657
Retirement benefits (including social security)	•	•
Fringe benefits	•	ن ٥
Interstate contracts and reciprocity payments	•	544,754
Service functions provided controlly (e.g., computer service, library, telephone, etc.)		49.300
Centrally administered capital/debt service	•	0
Other		٥

#### Clarification of Institutional Financial Reporting

These funds have been included in the MEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 6,318.635 appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 1,500,000 - auxiliary enterprises \$ 0 - other \$ 0

Tuition and Fees reappropriated by the state? No

Other Conments

Source: Oregon Educational Coordinating Commission

(Indexes shown in bold are based on U.S. average = 100)

### **PENNSYLVANIA**

#### Recent Trends

Pennsylvania increased appropriations to public higher education by only 24.3 percent between 1978 and 1982, far below the 44.2 percent national average. With enrollment growth of 2.1 percent and inflation of 44.3 percent (HEPI), appropriations per student in constant dollars declined 15.6 percent, far more than the national average decline of 5.3 percent. Revenue from tuition and fees rose 56 percent during the four years, a constant-dollar increase of 5.9 percent. However, this improvement was insufficient to offset the decline in appropriations. As a result, total educational and general revenues per student in constant dollars declined 5.8 percent. Losses in the purchasing power of state and total revenues for public higher education were evident in fiscal years 1980, 1981, and 1982. Faculty salaries increased 32 percent during the four years, but the 50.2 percent increase in the CPI meant that salaries lost 12 percent in purchasing power.

The state's 134 independent institutions had a sizable enrollment growth of 16.1 percent from 1978 to 1982. They also increased tuition revenues per student by 46 percent to match inflation. Revenues from other sources were slightly off pace. As a result, total educational and general revenues per student declined 1.4 percent in constant dollars. Faculty salaries increased 36 percent, representing a 9 percent loss in purchasing power.

#### State Financing of Higher Education

Relative to its population, Pennsylvania operates a very small public higher education system and in FY82 enrolled only 19.3 FTE students per 1,000 population, compared to the national average of 29.2 students per 1,000 population. Total appropriations for higher education were also low, \$66 per capita, 39 percent below average. Thus, appropriations of \$2,617 per student were 21 percent below average, ranking Pennsylvania 45th. Because public institutions received tuition revenues that were twice the national average, total funding per student was 5 percent above the national average.

Pennsylvania appropriated \$6.40 per capita for student aid (\$7.5.8 million), which was 1.5 times the U.S. average of \$4.20 per capita. Moreover, Pennsylvania appropriated a very high \$3.80 per capita for direct support of independent institutions. The state provided \$5.30 per capita for retirement benefits (\$57.5 million) and state boards and commissions (\$3.9 million).

#### State Tax Base and Budget

Pennsylvania had a below-average tax capacity of \$931 per capita in 1981, 10 percent less than the national average of \$1,030. The state ranked 34th in this respect. Tax capacity for both general sales and selective sales was about 10 nt below the U.S. average

Pennsylvania's tax effort was 5 percent above average, with a rank of 16th among the states. The state taxed selective sales at a rate 23 percent higher than the national average rate, resulting in additional revenues of \$308 million. Higher taxes than average for licenses brought in an additional \$397 million; individual income taxes brought in \$645 million and death and gift taxes an extra \$112 million. This was offset, however, by lower taxes on general sales and property than average, a combined loss of \$920 million in potential revenue. As a result of low capacity and high effort, collected tax revenues of \$976 per capita were 5 percent below the national average, ranking Pennsylvania 22nd in the nation in tax funds available to support public services.

Pennsylvania allocated only 6.8 percent of its tax revenues to higher education, compared to the national average of 10.9 percent. As a result of this low allocation rate and nearly average revenues, appropriations of \$66.10 percapita for institutional support, student aid, and other support were 3.9 percent below average, ranking Pennsylvania 49th in the nation.

If the total operating budget of Pennsylvania (including nontax and federal transfers) is considered, elementary/secondary education and public welfare received a larger share of the budget relative to national average allocations. Higher education, health and hospitals, and public services received a proportionately smaller share. Higher education received about half as much of the state's budget as was typical in other states.

#### Higher Education Eurollments

In FY \$2, residents of Pennsylvania were 13 percent less likely to continue their education than residents of other states, with 29 residents per 1,000 population attending college somewhere, below the national average of 34 residents per 1,000. Although a large number enrolled in private schools in the state, fewer residents attended state institutions or institutions in other states than was average nationally.

The 195 colleges and universities in Pennsylvania enrolled 412,117 FTE students in fall 1981. The public system, consisting of 61 institutions, enrolled 229,544 (56 percent) of the students, making it a much smaller enterprise than average (ranking 50th in the nation). University enrollment, as a share of the public total, was proportionately larger than the national mix (34.5 versus 32.1 percent), as was four-year college enrollment (33.6 versus 28.3 percent). However, two-year college enrollment was proportionately smaller (31.9 versus 37.8 percent). The 134 independent institutions in the state enrolled 182,573 FTE students in fall 1981, a very large enterprise relative to the state's population (ranking 7th in the nation).

In FY82, Pennsylvania had an above-average number of high school graduates per 1,000 population compared to the nation, but only 35.7 percent entered state institutions, below the national rate of 62.5 percent. In-migration of nonresident students was half the national average. Student retention at public institutions was slightly below average, while full-time enrollments were above average. In the independent sector, residents made up 63 percent of enrollments at Pennsylvania's private institutions, slightly above the national level of 60 percent.

#### Institutional Finances and Characteristics

State appropriations for public higher education in Pennsylvania were below average for each type of institution except for the other professional and specialized (Pennsylvania State University -- Radnor Center). The medical research university (University of Pittsburg) received appropriations per student that were 32 percent below average; appropriations to the nonmedical university (Pennsylvania State University) were 29 percent below average; and appropriations to the medical university (Temple University) were 6 percent below average. In each instance the deficiency was more than made up by high tuition revenues, averaging more than twice the national average. (Pennsylvania ranks 3rd in the nation in tuition revenues at public institutions.). Thus, all public institutions except the health-professional institution obtained total educational and general revenues per student that were close to or greater than the national average. Expenditures for instruction per student and academic support per faculty member were generally near or above average. Faculty salaries were also competitive.

In the independent sector, the medical research university (University of Pennsylvania) received tuition revenues 6 percent above average but had a low level of private gifts and grants and other revenues. As a result, total educational and general revenues per student were il percent below average. As a research university without medical programs, Carnegie-Mellon University was substantially underfunded, by 31 percent. The 8 comprehensive colleges, enrolling 31,275 students, were funded at a level 16 percent below average, while the 51 baccalaureate colleger, enrolling 64,826 students, were funded at the national average. Faculty salaries were close to or above national averages.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operatione

Only state and local funds not reported by the institutions through the MEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Ald	8 75,801,578
Poeteecondary vocational technical aducation	<b>8</b> 0
State boarde and confleetone	8 3,934,003
Retirement benefits (including educal escurity)	\$ 57,505,870
Friige benefits	• 0
Interetate contracte and reciprocity paymente	8 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	\$ 629,791
Centrally administered capital/debt service	<b>8</b> 0
Other (BMS, CSC, and Comptroller's Office State College Support Service)	\$ 757,853 (eetimate)

#### Clarification of Institutional Financial Reporting

These funde have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funde revenues dedicated to capital purposes:

- tuition and fees \$ 0 - auxiliary enterprises \$ 0 - gebor \$ 9,542,745
- Tuition and Feee reappropriated by the state? Yes*

#### Other Connents

* Funds collected by the 14 state-owned colleges and universities (tuition/room and board) were reappropriated to the individual inetitutions. All other higher education inetitutions were not involved in this procedure.

The special categories of state-related and state-aided in Pennsylvania do not provide as sharp a distinction between public and private institutions as in other states.

(indexes, shown in bold are based on U.S. average = 100)

## RHODE ISLAND

#### Recent Trends

Between 1978 and 1982, appropriations to public higher education in Rhode Island increased by only 28.5 percent, compared to the national average of 44.2 percent. Thus, with enrollment growth of 5.3 percent and inflation of 44.3 percent (HEPI), appropriations per student in constant dullars declined 15.4 percent, substantially greater than the average national loss of 5.3 percent. Institutions made up. almost half of this loss by increasing tuition revenues 10.7 percent per tudent in constant dollars and by improving funding from other sources. As a result, total educational and general revenues per student in constant dollars declined only 7 8 percent. Constant-dollar declines were visible in both state support and total operating budgets in fiscal years 1980, 1981, and 1982. Faculty salaries rose 29 percert, but given the 502 percent increase in the CPI, this meant a 14 percent loss of purchasing power

The nine independent institutions in Rhode Island grew by 4.5 percent, increased tuition revenues a substantial 6.7 percent, and managed to improve total educational and general revenues in constant dollars by 15.3 percent per student, the 5th-highest increase in the nation. Faculty salaries were increased 4.2 percent during the four years, almost enough to offset inflation, with a loss in purchasing power of only 5 percent.

#### State Financing of Higher Education

Rhode Island operates a somewhat smaller public system of higher education than average and in FY82 enrolled 26.3 FTE students per 1,000 population, compared to the national average of 29.2 per 1,000 population. Total appropriations for higher education of \$90.00 per capita were similarly low, 16 percent below average. As a result, appropriations of \$3,124 per student were 6 percent below average, ranking the state 2.9th. Despite higher tuition revenues than average, poor funding from other sources prevented any improvement in total funding per student, so total educational and general revenues per student were 5 percent below the national average.

The state of Rhode Island appropriated \$5.80 per capita for student aid, 39 percent above the U.S. average of \$4.20 per capita. The state also provided \$1.20 per capita to support independent institutions.

#### State Tax Base and Budget

Rhode Island is a poor state as measured by tax potential and had a capacity of \$827 per capita in 1981 (45th in the nation), 20 percent below the national average of \$1,030. The state had below-average capacity in all tax categories.

Despite a low tax potential, the tax effort of Rhode Island was 30 percent above average, with a state rank of 5th. Selective sales were taxed at a rate 21 percent higher than average, providing additional revenues of \$23 million; individual income was taxed at a rate 23 percent above average, for an additional \$36 million, and property was taxed at a rate 76 percent above average, to provide an additional \$185 million. As a result of low capacity and high effort, the state collected tax revenues of \$1,075 per capita, 4 percent above the national average. This placed Rhode Island 16th in the nation in tax funds available to support public services.

Rhode Island allocated 8.4 percent of its tax revenues to higher education, below the national average of 10.5 percent. This low rate plus average revenues resulted in appropriations of \$90 per capita for institutional support, student aid, and other support, 16 percent helow average, ranking Rhode Island 36th in the nation in its support of higher education

If the total operating budget of Rhode Island (including nontax and federal transfers) is considered, public welfare and other programs received a larger share of the budget relative to national average allocations. The other functions, including higher education, received a proportionately smaller share. Higher education's share of the budget decreased from 8.6 percent in 1978 to 8.1 percent in 1982.

#### Higher Education Enrollments

In FY82, Rhode Island residents attended college at national average rates, with 34 residents per 1,000 population enrolled somewhere. A relatively low proportion, 62 percent, attended public institutions within the state, a factor that is redressed by higher rates of attendance at independent institutions in state and at institutions in other states.

The 12 colleges and universities in Rhode Island enrolled 51,861 FTE students in fall 1981. The public system, consisting of three institutions, enrolled 25,055 (48 percent) of the students, making it a smaller enterprise than average relative to the state's population. University enrollment, as a share of the public total, was proportionately larger than the national average (46.5 versus 32.1 percent). Comprehensive enrollment was equivalent to the national average, and two-year college enrollment was smaller (28.6 versus 37.8 percent). The nine independent institutions in the state enrolled 26,806 FTE students in fall 1981, a very large sector relative to the state's population (ranking 3rd in the nation).

In FY82, Rhode Island had an average number of high school graduates per 1,000 population compared to the nation; a large proportion, 70.4 percent, entered the state's public institutions, well above the national average rate of 62.5 percent. In-migration of nonresident students (sugresting the accessibility and attractiveness of the public system) was twice the national average. Student retention was below average, and full-time enrollments were average. In the independent sector, residents made up 30 percent of enrollment, far below the national level of 60 percent.

#### Insutational Finances and Characteristics

The University of Rhode Island, with 11,654 students, received state appropriations per student that were 14 percent below the national average for research universities without medical programs. Despite higher tuition than average, other revenues were low. As a result, the total educational and general revenues per student were 15 percent below the U.S. average. Rhode Island Coilege, with 6,226 students, received average appropriations for a comprehensive institution and had average total E&G revenues. Rhode Island Community College, a two-year academic college enrolling 7,175 FTE students, secured appropriations that were 10 percent above average. With high revenues from tuition and private gifts and grants, it functioned with total educational and general revenues per student that were 11 percent better than average.

Rhode Island College had the lowest relative expenditures for instruction among public institutions in the state but very high academic support expenditures. The University of Rhode Island had nearly average or above-average expenditures for all functions except research per faculty member, which was 29 percent below average. Full-time faculty salavies in the public sector were slightly below the national average.

The state has nine independent institutions. Brown University was the best funded, with total educational and general revenues per student 5 percent above average for universities with medical programs. The two baccalaureate colleges had the lowest funding, 19 percent below the national average. Faculty salaries at Brown University were 13 percent above the national average; salaries in the private sector were generally good in Rhode Island.

### **Data Notes**

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$	4,423,456
Postsecondary vocational technical education	\$	0
State boards and connissions		697,153
Retirement benefits (including social security)	\$	0
Fringe benefits	•	0
Interstate contracts and reciprocity payments	•	0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	1	0
Centrally administered capital/debt service	\$	0
Other		0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 0
- auxiliary enterprises \$ 0
- other \$ 5,304,061*

Tuition and fees reappropriated by the state? No

Other Conments

The review of these data by the Rhode Island Office of Higher Education revealed that appropriations for the public two year academic schools should be \$14,995.101 and for the independent institutions should be \$1,167,279. These figures differ slightly from those reported by the institutions in HEGIS that are used in this document.

(Indexes shown in bold are based on U.S. average = 100)

^{*} Debt service on borrowing to pay for current operations.

## SOUTH CAROLINA

#### Recent Trends

Fiscal year 1982 was a difficult one for public higher education in South Carolina. Funding from the state fell by h percent despite a nearly 1 percent increase in enrollments. When inflation for the year is factored in, the net effect was a slump of 10.5 percent in the value of state monies for higher education. Tuition revenues compensated to some degree, rising 9.6 percent in constant-dollar terms. Still, the total pool of revenues available to support the higher education enterprise in South Carolina was reduced by 70 percent, after adjustment for inflation and enrollment increases. Only seven other states faced more restrictive fiscal conditions than did South Carolina These decreases were pervasive for all categories of public institutions, except the health professional (the Medical University of South Carolina), which had a constant-dollar gain in support of 3.4 percent. Losses in the other sectors ranged from 5 to 10 percent

While FY82 and FY81 were both years of fiscal retrenchment for public higher education in South Carolina, the four-year period (FY "8 through FYX2) produced a small not gain in funding of 1.3 percent even after adjustment for inflation and enrollment gains, which pliced South Carolina among the 20 states showing positive gains The increase in total funding was largely fueled by significant boosts in tuition collections, which jumped nearly 30 percent in adjusted dollars. Only four other states had greater gains in tuition. These increases in tuition were sufficient to reverse the 4.2 percent drup in constant-dollar state funding and to provide a small gain in funding resources. All but two sectors had some improvement in their support from 1978 to 1982. The two sectors that lost ground included the medical university (University of South Carolina -- Columbia), with a drop of 2 percent in resources, and the baccalaureate sector, with a drop of 43 percent. The two-year sectors and the nealth-professional schools had a major increase in purchasing power during this time, between 13 and 24

The private institutions, despite a drop in the value of tuition and a 7 b percent surge in enrollments, were able to maintain a level funding base (after adjustment for int. tion). The profile by sector was uneven, however, with two sectors gaining and two losing

#### State Financing of Higher Education

The state spent \$109 per capita for higher education in EY82, a level 2 percent above the average. Ninety-six per ent of these expenditures were allocated to public

institutions, primarily in the form of direct institutional support. Through student aid, 3 percent of the state's funds for higher education supported students enrolled at private institutions. There is no similar aid program for students in the public sector.

#### State Tax Base and Budget

South Carolina collects \$738 per capita in state taxes, a level 28 percent below the norm. The comparatively low revenue results from a tax capacity 25 percent below average and is compounded somewhat by a state tax effort that is 5 percent below average. South Carolina's tax capacity is well below average in all categories. (Only two other states (Mississippi and Alabama) have a lesser base of taxable economic activity to draw upon. The state's tax structure emphasizes income tax, both individual and corporate, and nationally ranks 14th and 17th, respectively, in tax effort with these sources

Elementary/secondary education receives the largest portion (31.4 percent) of direct general expenditures by state and local governments in South Carolina. Health and hospitals follow at 13.9 percent. The share going to higher education, 12.7 percent of the budget, is 3.3 percent above average and places South Carolina's per capita expenditures for higher education above national levels—a considerable achievement in view of the state's weak overall venue picture.

#### Higher Education Enrollments

South Carolina residents participate in higher education in below-average numbers. They attend their own public institutions at nearly typical rates, but fewer than average attend private institutions in state or institutions out of state. At the same time, in-migration to South Carolina's public institutions is 10 percent above average. Total enrollment in public institutions (relative to the state population) is just below national levels because of a low rate of first-time entrance by residents as well as a comparatively low retention rate. South Carolina has 28 FTE students per 1,000 population enrolled in its public institutions, a level 6 percent below the national average.

The two universities in the state enroll 35 percent of the students in the public sector, with another 34 percent of students represented in the 16 two-year occupational schools. In the private sector, half (51 percent) the enrollment is concentrated in baccalaureate institutions. Overall, South Carolina's public sector enrolls 81 percent of the higher education students, slightly more than the US average (76 percent).

#### Institutional Finances and Characteristics

State and local appropriations per student for public higher education in South Carolina are 8 percent above average. and the state's public institutions rely more heavily than usual on these revenues, obtaining 65 percent of their funds from this source. Given recent increases in tuition, tuition revenues are now 5 percent above average. As a group, public institutions in South Carolina do better than average in total E&G revenues per student (excluding government contractas, despite recent losses in purchasing power. On average, the public institutions functions with 9 percent more per student in general operating fun is (excluding government grants and contracts), and all sectors except the two largest, the medical university (index 51) and the occupational two-year schools (index 84), have above-average or close to average revenues. For instance, Clemson University (nonmedical research university) has 40 percent more revenues por student than the average for institutions in its group, primarily because of above-average state funding. The academic/comprehensive two-year schools (index 112) and the Medical University of South Carolina (index 112) are next in relative funding. The comprehensive institutions receive funds that are 3 percent above the average, and the public general baccalaureates are funded at just 2 percent below average. In general, given low state revenues, state funding for higher education in South Carolina is impressive.

The private sector in South Carolina is not fin need as well as the public sector, comparatively speaking. Total B&3 revenues per student (excluding government contracts) are nearly 40 percent below the no.m for the private sector as a whole. Tuition revenues per student are 33 percent below average even though dependence on tuition, which represents nearly 60 percent of all revenues, is above average. There is a total of 58 institutions in South Carolina, of which 33 are public. Clemson is small for its type, while the University of South Carolina—Columbia is larger than average for schools with similar missions.

Despite a generally positive funding situation, faculty salaries in public institutions are below average, and particularly so in the two-year institutions and health-professional school. However, consonant with the receit gains in revenues for higher education betwien 1978 and 1982, faculty in South Carolina made major strides forward. Their salaries climbed 52 percent at a time when their peers elsewhere had gains of only 36 percent. Faculty salaries in the private sector average 6 to 16 percent lower than national rates for similar types of institutions.

### **Data Notes**

1981-82

Additional State and Local Government funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$ 11,800,533
Postsecondary vocational technical education	<b>\$</b> 0
State boards and connissions	\$ 770,981
Retirement benefits (in luding social security)	<b>\$</b> 0
Fringe benefits	\$ 0
Interstate contracts and reciprocity payments	\$ 596,250
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	\$ 0
Centrally administered capital/debt service	<b>\$</b> 0
Other	<b>\$</b> 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 0 appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 0 - auxiliary enterprises \$ 0 - other \$ 0

Tuition and Fees reappropriated by the state? No

#### Other Comments

The portion of required fees labeled "tuition" is required by law in most instances to be remitted to the State Treasurer for debt service. A significant proportion of student fees is used for capital expenditure and debt services.

Source: South Carolina Commission on Higher Education

(Indexes shown in bold are based on U.S. average = 100)

## **SOUTH DAKOTA**

#### Recent Trends

Between 1978 and 1982, South Dakota's public institutions experienced a 12 9 percent enrollment increase, 4th largest in the country. This expansion, plus 44.3 percent (HEPI) inflation, offset an appropriation increase of 39.0 percent, resulting in a 14.7 percent reduction in constant-dollar appropriations per student. An attempt was made to make up this loss by increasing tuition revenues 85 percent, representing a 13 6 percent increase per student in constant dollars. But despite the increase in tuition and the improvement in revenues from other sources, there still was a reduction in total educational and general revenues per student of 9.7 percent in constant dollars. Only five other states faced more constrained financial circumstances. Faculty salaries increased 38 percent, but with a 502 percent increase in the CPI during the four years, faculty experienced a 9 percent loss in purchasing power.

Enrollment declined 6.0 percent at the II independent institutions in the state, compared to a national gain of 5.6 percent, and revenues from tuition and other sources increased to more than match inflation. This resulted in a 3.6 percent increase in educational and general revenues per student in constant dollars. Faculty salaries increased 32 percent, resulting in a 12 percent loss in purchasing power

### State Financing of Higher Education

Relative to its population, South Dakota operates a slightly larger public higher education system, than average and in FY82 enrolled 310 FTE students per 1,000 population, compared to the national average of 292 per 1,000 population. Total per capita appropriations of \$87.60 for higher education were 19 percent below average. As a result, appropriations per student of \$2,567 were 2.3 percent below average, ranking the state 46th in the nation Tuition revenues of 20 percent above average and revenues from other sources increased total funding per student to near the national average.

South Dakota appropriated only \$10 per capita for student aid, substantially below the U.S. average of \$420. The state also appropriated \$44 million to support its vocational-technical institutes, which enrolled 2,458 FTE students, and \$783,000 for state boards and commissions. Independent institutions in South Dakota received no direct state support.

#### State Tax Base and Budget

South Dakota has below-average tax potential and had a capacity of \$889 per capita in 1981 (40th in the nation), -14 percent below the national average of \$1,030. The state had below-average capacity in individual and corporate

income and in residential and commercial property. Farm property had 5.3 times the national average tax capacity per capita.

Sout:, Dakota's tax effort was 7 percent below average. with a state ran!: of 27th, an improvement over the state's effort in 1980, which was 12 percent below average. The state has no individual income tax, in 1981 representing a loss of \$89 million in potential revenues. Corporate income was also undertaxed. Property was taxed at a rate 32 percent above the national average rate, resulting in additional revenues of \$61 million. The combination of low tax capacity and low tax effort resulted in collected tax revenues of \$826 per capita, 20 percent below average and ranking South Dakota 37th in the nation in tax funds available to support public services. South Dakota allocated 10 6 percent (index 101) of its revenues to higher education This average rate plus low collected tax revenues resulted in appropriations of \$87.60 per capita for institutional support, student aid, and other support, 19 percent below average, ranking South Dakota 39th in the nation

If the total operating budget of South Dakota (including nontax and federal revenues) is considered, highways received a much larger share of the budget relative to national average allocations; public welfare and health and hospitals received a proportionately smaller share. Higher education's share was 4 percent greater than average, though it was reduced from 11.3 percent in 1978 to 10.0 in 1982.

#### Higher Education Enrollments

In FY82, South Dakota had 36 residents per 1,000 population attending college somewhere, 7 percent above the national average of 34 students per 1,000 population Access was above average at institutions both in and out of state

The 18 colleges and universities of South Dakota enrolled 28,750 FTE students in fall 1981. The public system, consisting of seven institutions, enrolled 21,418 (74 percent) of the students, a nearly average share. Comprehensive and baccalaureate enrollments, as a share of the public total, were proportionately much larger than the national mix (85 6 versus 28 3 percent), while two-year college enrollment was much smaller (3.4 versus 37.8 percent). The 11 independent institutions in the state enrolled 7,332 FTE students in fall 1981, a larger enterprise than average relative to the state's population.

In FY82, South Dakota had a large number of high school graduates per 1,000 population compared to the nation, but only 39.0 percent entered state public institutions, well below the national entrance rate of 62.5 percent In-migration of nonresident students (reflecting the

accessibility and attractiveness of the public system) was nearly twice the national average. Student retention was above average, as were full-time enrollments. In the independent sector, residents made up 56 percent of enrollments, below the national level of 60 percent.

ij

#### Institutional Finances and Characteristics

Relative to national averages, state appropriations were disproportionately allocated among the various types of institutions in South Dakota. The two comprehensive institutions—the University of South Dakota and South Dakota State University—received appropriations 5 percent below the national average. The three baccalaureate colleges and South Dakota School of Mines and Technology (professional) received appropriations 34 and 40 percent below average for their respective types of institutions. The single two-year occupational college had appropriations 20 percent above average.

Except for the School of Mines, tuition revenues at public institutions in South Dakota were above average. The comprehensives also had very high revenues from other sources, so their total educational and general revenues per student were 28 percent above average.

The baccalaureate colleges failed to make up their low appropriations with higher tuition and other revenues. Total funding, therefore, fell 9 percent below the national average. The same held true for the School of Mines, with total educational and general revenues per fudent 20 percent below average. Expenditures for instruction of \$1,791 per student at the School of Mines were 35 percent below average.

Despite receiving nearly average tuition revenues, the state's six independent baccalaureate colleges operated with total educational and general funding that was 13 percent below average. Faculty salaries were 10 percent below average.

## **TENNESSEE**

### Recent Trends

State funding for public higher education in Tennessee in FY82 increased at a very strong rate, 14.6 percent. After adjustment for inflation and enrollment shifts, this meant a 4.9 percent real boost in state support. Only three states in the nation did better (Texas, 11.7 percent; Montana, 10.8 percent; and Oklahoma, 6.1 percent) in FY82. Supplemented by a real-dollar surge of 10.3 percent in tuition collections, the value of funding in Tennessee showed a significant gain of 7.5 percent, after adjustment for inflation. Only Texas and Montana surpassed Tennessee on this measure.

Although FY 1982 was clearly a year of strong funding improvement, it followed a year in which revenues had fallen by 5.2 percent in real-dollar terms. But Tennessee's 1978 to 1982 profile was one of progress in funding, with constant-dollar gains of 2.9 percent per student. Tennessee ranked 14th among the states in such gains, and in light of the average loss of 2.3 percent felt nationally, the state's increase is even more significant. Three of the six categories of public institutions participated in these gains, with risflation-adjusted improvements ranging from 11.0 to 163 percent. Of those that did not, the large comprehensive sector saw the value of its funding shrink by 13 percent, and 'osses for the two-year sector ranged from 2.5 to 10.6 percent.

During the same period (1978 to 1982), the private sector had an even larger overall gain in spending power per student of 38 percent. However, the funding of specific sectors varied significantly. The academic/comprehensive two-year sector lost 17.1 percent in purchasing power. The two largest categories of private institutions, the baccalaureates and the medical research universities, fared reasonably well. The baccalaureates basically stayed even for the period, while the university had gains of 6.6 percent in its real-dollar spending base.

#### State Financing of Higher Education

Tennessee spends \$74 per capita for higher education, a level 31 percent below average and 43rd among the states. Of those expenditures, 93 percent goes toward general institutional support, 2 percent goes to student aid, and the remaining 5 percent is allocated to indirect support (primarily for postsecondary vocational education). Just about all (98 percent) of the state's support to higher education is channeled to the public sector, with only a small share of state funds aiding students attending both public and private institutions.

#### State Tax Base and Budget

Tennessee falls below the national average in both tax capacity and tax effort. Accordingly, state and local tax revenues per capita of \$707 are 31 percent below average, placing Tennessee 4th from the bottom among the states in the funding of public services. The state ranks 48th in overall tax capacity and does not exceed average capacity in any individual tax category, although Tennessee's tax effort is relatively high with respect to general sales, licenses, and death and gift taxes. The major revenue source in the state is general sales taxes, which, along with selective sales and property taxes, account for 86 percent of total revenues.

Health and hospitals (index 130) and highways (index 118) are priority state functions in Tennessee, while public welfare (index 85) is the one function that receives substantially less funding than is typical. Higher education receives a slightly smaller share than average, though its share of the state budget slipped noticeably between 1978 and 1982, from 10.9 percent to 9.3 percent.

#### Higher Education Enrellments

Residents of Tennessee attend higher education institutions at a rate of 28 students per 1,000 population, 17 percentelow national norms. These low participation rates apply to Tennessee students attending public, private, and out-of-state institutions. (If enrollment in the postsecondary vocational-education sector were included, these rates would be higher.) These below-average attendance rates combined with below-average enrollment of out-of-state students in public institutions result in a total enrollment in the public sector that is 14 percent below average. Tennessee has 25 FTE students per 1.000 in its public system, compared to the national profile of 29 per 1,000.

On the other hand, out-of-state enrollments in Tennessee's private institutions are 45 percent above average, compensating for low resident enrollment and creating an average-size private sector. Enrollments in Tennessee are therefore somewhat more oriented toward the private sector than is typical.

Public enrollments are concentrated in three sectors: the universities, 41 percent; the comprehensive institutions, 32 percent; and the two-year colleges, 26 percent. A slightly higher than average proportion (9 percent) of students is studying at graduate levels. Private enrollments are highly concentrated in baccalaureate institutions—61 percent

Between 197\$ and 19\$2, public enrollments grew at rates below those in the private sector, 4.\$ percent versus \$.5 percent. At 159,103 FTB students, Tennessee's total enrollment is the 1\$th largest in the nation.

### Institutional Finances and Characteristics

Tennessee's public colleges and universities are funded at rates below the national average. Although attenuance at the public sector was 14 percent below average in fall 1981, state funding at 29 percent below average was even lower, creating a level of state funding that, at \$2,757 per student, was 17 percent below national rates. This profile worsened from 1979, when the state's public sector was 13 percent behind. All categories of public institutions are underfunded by the state, at rates between 4 and 43 percent below average. As was indicated previously, Tennessee is among the poorest states in the United States. Because Tennessee allocates an average share of these smaller tax revenues to higher education, state support per student is below the national average. If total B&G revenues per student (excluding government contracts) are used as the measure, public institutions in Tennessee receive an average of \$4,221 per student, a level 14 percent below U.S. averages.

Within the public sector, no sector is funded at the average for comparable institutions; the academic/comprehensive two-year institutions come the closest (index 98). The universities (University of Tennessee-Knoxville and East Tennessee State University) operate with funds 24 percent below average. The health-professional school (the University of Tennessee Health Science Center) is funded at 32 percent below average. The six comprehensive institutions operate with 13 percent fewer funds per student than similar schools.

Funding in the major segments of private higher education in Tennessee is also below average. In the largest sector, the private baccalaureates, total funding is 20 percent below average. In part, this lower funding is due to the lower proportion of revenues coming from tuition.

Reflective of these lower operating budgets, faculty salaries are generally below average in both the public and private sectors. Tennessee's 24 public institutions are generally larger than average, while the 52 private institutions are typically far smaller than similar institutions elsewhere.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	\$ 5,177,274
Postsecondary vocational technical education	\$ 13,756,963
State boards and conmissions	\$ 4,108.935
Retirement benefits (including social security)	\$ 0
fringe benefits	\$ *
Interstate contracts and reciprocity paymente	<b>\$</b> •
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>6 0</b>
Centrally administered capital/debt service	<b>\$</b> •
Other	8 0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to Clarify differences impractices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 4,238,209
- anxiliary enterprises \$ 0
- other \$ 0

Tuition and fees reappropriated by the state? No

#### Other Connents

Source: Tennessee Higher Education Commission

(Indexes shown in bold are based on U.S. average = 100)

^{*} Retirement benefits are appropriated centrally but are reported in state appropriations by the institution on the HEGIS finance form.

## **TEXAS**

#### Recent Trends

Bolstered by an increase of nearly 25 percent in state appropriations, public higher education in Texas had a real-dollar gain of 9.3 percent per student in its general revenue base (excluding government grants and contracts) in FY82. Texas led the nation in overall higher education purchasing power gains as well as in state financing improvements. The infusions from the state more than compensated for the 5.4 percent decrease in the value of tuition support. The impact of these gains by sector was mixed. Although all but two categories of institutions experienced some improvement in their funding bases, the size of these shifts varied from . 8 percent in constant dollars per student at the nonmedical research university (University of Texas -- Austin) to more than 250 percent at the other professional and specialized institutions. For the two university groups that had an erosion in their nurchasing power, the declines were not insignificant and ranged from 4.9 to 11.8 percent.

Over the longer term, FY78 to FY82, the profile of strong financial improvement for public higher education in Texas is also evident. During those four years, inflation-adjusted revenues per student in Texas jumped 9.6 percent. Only four other states experienced a greater margin of improvement in their funding (Oklahoma, Alaska, West Virginia, and North Dakota).

Again, however, when sector-by-sector circumstances are examined, the profile that emerges is mixed. The University of Texas--Austin and the University of Houston--Central Campus (the medical university) both experienced erosions in purchasing power of approximately 10 percent per student. By contrast, for the medical research university (Texas A&M), there was a 5.3 percent gain in the value of funding between 1978 and 1982, and the five universities without medical programs had a small gain of .4 percent. The two largest sectors had gains of approximately 5 percent (the comprehensive schools and the academic/comprehensive two-year institutions). Other sectors experienced gains ranging from 1.7 to 254.2 percent.

Overall, then, this period for Texas was one of strong general gains fueled by a major infusion of state support; at the same time, significant sector differences are evident. Gains were also posted for independent higher education in Texas both in FY82 and for the 1978 to 1982 period (3.7 and 12.4 percent respectively).

### State Financing of Higher Education

In 1982, Texas provided funding to support higher education that was 30 percent higher than the national

average. This level of support for public higher education ranks Texas \$th in the nation and is a substantial improvement over prior funding levels. The \$140 per capita allocated to higher education is not surprising given the inherent taxable wealth of the state. It is impressive, however, given the state's low tax levels and the resulting lower tax revenues, which are 15 percent below average. The state's support for higher education is above average because it allocates a larger than average share of its budget to this state function

The majority of higher education dollars in Texas support public institutions directly; of the \$140 per capita designated for higher education, \$129 is given to public institutions. The remaining \$11 is spread across student aid, private institutional aid, and other functions.

#### State Tax Base and Badget

Texas is the fourth-richest state in the nation in terms of taxable economic activity, with a total tax capacity 32 percent above average. The state has above-average capacity in 9 of the 10 potential tax categories, the exception being residential property. Texas, however, has very low tax rates (only Nevada has a lower overall rate). Despite its above-average tax capacity, Texas is above average in tax effort in only one category: licenses. The state has no income tax (neither individual nor corporate), relatively low property tax levels, and low sales-tax rates. As a consequence, the state collects 35 percent less in tax revenues than its strong tax capacity would yield at average tax rates. Because the state begins with a strong tax capacity, actual tax revenues are only 15 percent below average.

A larger than average share of the Texas state budget goes to each category except public welfare, public services, and other. Public welfare in particular receives about half of the typical share of the budget accorded by the states. Higher education received 12.3 percent of the budget in Texas in 1982, a slight drop from 1978 though still a very favorable share in comparison to the 9.6 percent national average.

### Higher Education Enrollments

Thirty-five of every 1,000 Texas residents are enrolled full time in higher education, a level 5 percent above the national average. These access levels are provided principally through the public sector, as only a small proportion of students are enrolled in private i..stitutions in Texas and only a very small number of Texans go out of state for higher education.

The public sector in Texas accommodates 6 percent more FTE students (residents and nonresidents) than average.

Although the state's rate of high school graduations is below average, large numbers of first-time students and nonresidents create a pool of first-time students 10 percent larger than average. Total attendance levels are further increased by above-average numbers of full-time students. In sum, the state's public institutions earoll 31 FTE students per 1,000 residents versus the national rate of 29 per 1,000.

The structure of higher education in Texas is fairly similar to the national pattern, though there is a slightly greater emphasis on the university and comprehensive level. As a consequence, the proportion of students enrolled at the graduate level is 26 percent above average. This creates additional funding requirements for Texas as compared to other states. But the larger average size of its institutions in the public sector counterbalances these costs to some degree.

### Institutional Finances and Characteristics

In the public sector in Texas, state appropriations and enrollments are both above average, and state support per student is 25 percent above average. This support is unevenly distributed among various categories of public institutions. State funding is below average by 6 percent at the nonmedical research university and by 4 percent at the comprehensive institutions. At all other categories of public institutions, state support per student exceeds national levels and generally by large amounts, ranging from 9 percent to nearly 300 percent above average. These levels represent an increasingly important role for state funding, which carried 65 percent of the public institutions' budget in 1982 compared to 60 perce four years earlier.

Tuition revenues at pu'ic institutions in Texas continue to be substantially lower than those collected elsewhere; on average, they are 44 percent below U.S. norms. Every category of public institution follows this pattern, with most collecting tuition revenues between 40 and 60 percent below average. By contrast, revenues from private gifts are above average by 34 percent. Total revenue patterns, however, vary by sector. Four of the ten public sectors in Texas function with revenues that are 5 to 13 percent below average (including three of the university sectors and the comprehensive-institutions sector).

Gains in funding between 1978 and 1982 were accompanied by gains in faculty salary. Salaries in Texas grew 9 percent faster than the national average in this period. Still, statewide salary levels are 3 percent below average in the public sector. In the private sector, they are 4 percent below average.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student'A1d	\$ 19,868,955
Postsecondary vocational technical education	<b>\$</b> 0
State boards and connissions	\$ 10,758,457
Retirement benefite (including social security)	4 .
fringe benefits	8 0
Interstate contracts and reciprocity payments	\$ O
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	8 0
Centrally administered capital/debt service	8 0
· Other	8 93,654,014

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local 8 0 appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 0 - auxiliary enterprises \$ 0 - other \$ 0

Tuation and fees reappropriated by the state? Yes

#### Other Comments

4 It is not possible to identify the amount appropriated for higher education employees.

(Indexes shown in bold are based on U.S. average = 100)

## UTAH

#### Recent Trends

The 49.5 percent increase in appropriations for public higher education in Utah from 1978 to 1982 nearly matched enrollment growth and inflation. With enrollment increasing 4.7 percent and inflation at 44.3 percent (HBPI), appropriations per student in constant dollars declined 1.0 percent, a better record than the national average loss of 5.3 percent. Tuition revenues also gained in constant dollars. As a result, total educational and general revenues per student in constant dollars increased 5.4 percent. Faculty salaries increased 3.4 percent, but with the CPI increasing 50.2 percent, faculty purchasing power declined 11 percent.

The three independent institutions in the state decreased enrollments by 5.4 percent between 1978 and 1982. Tuition revenues per student increased sufficiently to cover inflation, and with high revenues from other sources, total educational and general revenues per student in constant dollars improved 10.3 percent. This increase was almost three times the national average. As in the public sector, faculty salaries at private institutions increased 34 percent.

### State Financing of Higher Education

Relative to its population, Utah operates a slightly larger public system of higher education than average and in FY82 enrolled 31.1 FTE students per 1,000 population, compared to the national average of 29.2 per 1,000 population. Total appropriations for higher education were proportionately larger, equal to \$116.80 per capita, 8 percent above average. Thus, appropriations per student of \$3,716 were 12 percent above the national average, ranking Utah 12th in the nation. High revenues from private gifts and grants and from other sources increased total funding per student to 26 percent above the national average.

Utah appropriated no funds for student financial aid, compared to the U.S. average of \$4.20 per capita. The state provided \$913,000 for state boards and commissione and \$903,000 for interstate contracts and reciprocity payments. Independent institutions in Utah received negligible state government support for operations.

#### State Tax Base and Budget

Utah had a tax capacity of \$890 per capita in 1981 (39th in the nation), 13 percent below the national average of \$1,030. The state's individual income tax potential was 32 percent below average.

Utah's tax effort was 3 percent below the national average, with a state rank of 22nd. The state had a heavy general sales tax that brottin an additional \$100 million in revenues over what would have been collected at national

average rates. Also, individual income was taxed at a rate 45 percent above the national average, resulting in \$92 million in additional revenues. This was offset, however, by \$89 million lost in potential property taxes and \$56 million lost in potential severance taxes. The combination of low tax capacity and average effort resulted in collected tax revenues of \$864 per capita, 16 percent below average and ranking Utah 35th in the nation in tax funds available to support public services.

Utah allocated 13.5 percent of its tax revenues to higher education, a high chare compared to the national average of 10.5 percent. This high rate created appropriations of \$116.80 per capita for institutional support and other support, 8 percent above average, ranking Utah 17th in the nation. If the total operating and capital budget of Utah (including nontax and federal transfers) is considered, higher and elementary/secondary education as well as highways received a larger share of the budget relative to national average allocations. Public welfare, health and hospitals, and public services received a proportionately smaller share.

### Higher Education Euroliments

In FY82, residents of Utah were 14 percent less likely to attend college than was average nationally. Although 8 percent more residents than average enrolled at the state's public institutions, fewer students enrolled in the independent sector or in other states. (Because data for Brigham Young University were not available for this study, the analyses for the independent institutions may be understated.)

The 12 colleges and universities in Utah enrolled 49,391 FTE studente in fall 1981. The public system, consisting of nine institutions, enrolled 47,259 (96 percent) of the students, an above—average share. University enrollment, as a share of the public total, was proportionately much larger than the national mix (56.5 versus 3.1 percent), as were general baccalaureate enrollmente (20.1 versus 3.9 percent). Two—year college enrollment was proportionately smaller (23.4 versus 37.8 percent). The three independent institutions enrolled 2,132 FTE students in fall 1981.

In FY82, Utah had an average number of high school graduates per 1,000 population compared to the nation. Of those, 60.5 percent entered state public institutions, near the national average rate of 62.5 percent. In-migration of nonresident students (suggesting the accessibility and general attractiveness of the public system) was twice the national average. Student retention was 8 percent below average, and full-time enrollments were above average.

### Institutional Finances and Characteristics

State appropriations were inconsistently allocated among the public institutions in Utah relative to national averages. Utah State University, a nonmedical research university, received appropriations that were 36 percent above average (ranked 5th among 17 states), while the University of Utah, a medical research university, received appropriations that were 19 percent below average. Appropriations at the two-year academic colleges were 39 percent above average (ranked 7th among 46 states). However, two-year occupational colleges received appropriations that were 10 percent below average. Utah State University and the two-year academic colleges received above-average tuition revenues. The combination of high tuition revenues and high appropriations for these echools caused total educational and general revenues to exceed the national average by 32 and 40 percent respectively.

Public institutions in Utah spent more than the national average for instruction and academic support per student. This did not hold true for the University of Utah, where low appropriations and tuition revenues created a correspondingly low expenditure pattern. Faculty salaries were generally near the national average except at the state's two-year academic colleges, where faculty salaries were 18 percent below the national average.

In the independent sector, Westminster College received twice the average revenues from private gifts and grants for a baccalaureate college, resulting in total funding that was 13 percent above average. The two two-year occupational colleges were substantially underfunded, receiving only half the total educational and general revenues per student typical for this type of institution.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional , finance report are shown here. The amounts shown to the instituted in the State and Local Government Support of Higher Education section on the First data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	•	0
Postsecondary vocational technical education	\$	0
State boards and Commissions		912,797
Retirement benefits (including social security)	\$	0
fringe benefits	•	0
Interstate contracts and reciprocity payments	\$	902,715
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	\$	102,608
Centrally administered capital/debt service	•	0
Other	•	0

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of stats and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 0 - auxiliary enterprises \$ 0 - other \$ 0

Tuition and feee reappropriated by the state? Yes

Other Connents

Brigham Young University, an independent nonmedical University, has been excluded from the analysis because of MEGIS data.

#### Recent Trends

Appropriations to Vermont's five public institutions increased 27.5 percent between 1978 and 1982, far below the 44.2 percent national average. With slight enrollment growth of 1.4 percent and inflation of 44.3 percent (HEPI), these appropriations represented a 12.9 percent loss per student in constant dollars. The national average reduction was 5 3 percent. Institutions more than made up this loss by increasing tuition revenues by 61 percent and by increasing revenues from other sources. As a result, total educational and gene al revenues per student in constant dollars increased 3.6 percent, while the national average declined 2.3 percent. Faculty salaries increased 39 percent. during the four years. However, this represents a 7 percent loss in purchasing power when the 50.2 percent increase in the CF, is taken into account.

Enrollment at the 14 independent institutions in the state declined 1.3 percent between 1978 and 1982, and tuition revenues increased a substantial 72 percent. This represents a 20 5 percent gain per student in constant dollars, 2nd highest in the nation. Revenues from other sources kept pace, so total educational and general revenues per student in constant dollars increased a remarkable 241 percent, an increase again ranking 2nd in the nation Faculty salaries in the private sector increased 40 percent. which represents a 7 percent loss in purchasing power over the four years

#### State Financing of Higher Education

In FY82, Vermont operated a system of public higher education that was 11 percent smaller than average relative to population, enrolling 26 0 FTE students per 1,000 population compared to the national average of 29.2 students per 1,000 population. Total per capitaappropriations of \$64.10 for higher education were of the lowest in the nation, 40 percent below average, ranking the state 50th. As a result, appropriations per student of \$1,874 were 44 percent below average, again ranking the state 50th. In order to balance the low state support. institutions received tuition revenues that were 3.4 times higher than the national average. In addition, substantial revenues from other sources raised total funding per student for all public institutions to a level 36 percent above the national average, ranking the state 3rd in this regard.

The state of Vermont appropriated \$10.50 per capita for student financial aid, the 3rd-highest rate in the country and 2.5 times the national average of \$4.20 per capita. The state also provided \$340,000 to postsecondary vocational-technical institutes, which enrolled 182 FTF students. Independent institutions in Vermont received no state appropriations for their current operations

#### State Tax Base and Budget

Vermont has a low tax potential and had a capacity of \$865 per capita in 1981 (41st in the nation), 16 percent below the national average of \$1,030. The state had below-average capacity in individual and corporate income as well as property.

Vermont's tax effort was 5 percent above average, with a state rank of 14th. The state collected \$73 million in additional property taxes because of higher rates than average, but lost \$80 million in potential revenue because of low general sales taxes. Individual income was taxed at rates 30 percent above the national average. As a result of low capacity and average effort, collected tax revenues of \$909 per capita were 12 percent below average, ranking Vermont 32nd in the nation in tax funds available to support public services.

Vermont allocated 7.1 percent of its tax revenues to higher education, far below the national average of 10.5 percent The low allocation plus low collected revenues resulted in appropriations of only \$64.10 per capita for institutional support, student aid, and other support. This was 40 percent below the national average and ranked Vermont 50th in the nation. Only New Hampshire appropriated less funding per capita for higher education.

If the total operating budget of Vermont (including nontax and federal transfers) is considered, higher education and highways received a larger gnare of the budget relative to national average allocations, while health and hospitals and public services received proportionately smaller shares. The large share for higher education contradicts the tax-derived profile and is due to different accounting procedures with census data

#### Higher Education Enrollments

On average, residents of Vermont were 16 percent less likely to pursue higher education in FY82 than residents of other states were. Although a relatively large number of residents enrolled in independent institutions in Vermont as well as in institutions in other states, resident enrollment in the state's public institutions was about one-third below the national average. This reduced the state's overall access levels.

The 19 colleges and universities in Vermont enrolled 24,293 FTE students in fall 1981. The public system, consisting of five institutions, enrolled 13,393 (only 55 percent) of the students, far below the 76 percent national average. University enrollment, as a share of the public total, was proportionately much larger than the national mix (69.0) versus 32.1 percent) as was baccalaureate college enrollment (25 4 versus 3.9 per ...) However, two-year college enrollment was much sm ... (5.7 versus 37.8)

percent). The 14 independent institutions in the state enrolled 10,900 FTE students in fall 1981. These institutions served 45 percent of all students, ranking Vermont 4th in the notion in this regard.

Vermont had an above-average number of high school graduates per 1,000 population compared to the nation, but only 21.7 percent entered the state's public institutions, far below the national entrance rate of 62.5 percent. In-migration of nonresident students (suggesting the accessibility and attractiveness of the public system to nonresidents) was 3.4 times the national average. Student retention was above average, as were full-time enrollments. In the independent sector, residents made up 25 percent of enrollments, well below the national level of 60 percent.

#### Institutional Finances and Characteristics

The University of Vermont and State Agricultural College received state appropriations of \$1,950 per student. This was 49 percent below average for a university with medical programs, lowest in the nation. However, by receiving revenues at twice the national average from tuition, private gifts and grants, and other sources, the university succeeded in obtaining total educational and general revenues per student that were 25 percent above average. Expenditures for all functions at the university were will above average, with public services per 1,000 capita provided at 39 times the national average. Faculty salaries were o percent below average.

The three public general baccalaureate colleges also received low levels of state support. However, because tuition revenues were twice the national average, they succeeded in reaching an average level of total educational and general revenues per student. The state's single two-year occupational college (Vermont Technical College) received state appropriations of \$2,348 per student, near the national average. When high tuition revenues were added, total educational and general revenues at this school were 53 percent above average.

Vermont's 14 independent colleges received tuition revenues per student that were 41 percent above average and were generally well funded, with the exception of the other professional schools. Instructional expenditures per student were generally above average, with faculty salaries close to or above average.

1981-82

Additional State and local Government funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$ 5,400,300
Postserondary vocational technical education	\$ 340.299 (188 FTE)
State boards and commissions	\$ 2,010,317*
Retirement benefits (including social security)	<b>\$</b> 0
fringe benefits	<b>\$</b> 0
Interstate contracts and reciprocity payments	\$ 182,116
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>\$</b> 0
Centrally administered capital/debt service	\$ 0
Other	• •

#### Clarification of Institutional Fanancia' Reporting

These funds have been included in the HEGIS reports ', t are noted here to clarify differences in practices among the states that affect the comparability of these data

Debt service that is part of state and local \$ 4,031,180 (estimate) appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

- tuition and fees \$ 929.800 - auxiliary enterprises 6 3,519,400** - other \$ 0

fultion and fees reappropriated by the state. No

#### ther Comments

- Part of this amount is for the Vermont State Colleges which includes systemaide services such as computing which are not readily separated from system administration.
- ** \$653,000 at the University of Vernont for debt service on university gym and library, \$278,800 at Vernont State tolleges for repairs, renovations or additions to capital facilities.

Source: Vermont higher Iducation Commission

(Indexes shown in bold are based on U.S. average = 100)

### **VIRGINIA**

#### Recent Trends

State appropriations for public institutions in Virginia increased 8.5 percent in fiscal year 1982. However, once adjustments are made for inflation and an enrollment gain of 6.4 percent, state funding actually declined 7.3 percent. Tuttion revenues also lost ground. As a result, the total operating budgets of public institutions experienced a 5.0 percent erosion in purchasing power, affecting all but two categories of institutions. These losses continued the pattern of funding retrenchment experienced in fiscal year 1981 and 1980. Surprisingly, though, gains in fiscal year 1979 were sufficient to create a 1.9 percent increase per student in constant dollars between 1978 and 1982.

Virginia boosted its state and local appropriations to public higher education by 731 percent between 1978 and 1982. Only five states exceeded this gain. The increase was 165 times the national average rate and covered both inflation of 443 percent (HEPI) and a 145 percent increase in enrollments. As a consequence, state funding grew 46 percent in real dollars per student, an increase ranking 9th in the nation. However, increased revenues from tuition and other sources failed to keep pace with inflation. Thus, the increase in total educational and general revenues per student was a more modest 19 percent, but still better than the national average, which declined 2.3 percent. Faculty salaries increased 39 percent during the four years, but a 50.2 percent increase in the CPI produced a 7.5 percent decline in purchasing power.

Enrollment at the state's 30 independent institutions grew 8.8 percent between 1978 and 1982. Tuition increases generally matched inflation, and revenues from other sources increased substantially. As a result, total educational and general revenues per student in constant dollars inc.

3.6.6 percent, well above the 3.7 percent 3.7 average. 4 culty salaries increased 36 percent, for a 9.5 percent loss in purchasing power.

#### State Financing of Higher Education

Relative to its population, Virginia operates a larger public higher education system than average and in FY82 enrolled 53-0 ETF students per 1,000 population, compared to the national average of 29-2 students per 1,000 population. However, total appropriations of \$102-70 per capita for higher education were 5 percent below average. As a result, appropriations per student of \$2,977 were II percent below the national average, ranking the state 35th. Slightly higher tuition revenue, than average and private gifts and grants increased total sunding per student slightly, to only 8 percent below the national average.

Virginia appropriated \$2.20 per capita for student financial and, compared to the national average of \$4.20 per capita, and spent \$80 per capita in support of independent institutions. State boards and commissions received \$6 million in state support.

#### State Tax Base and Budget

Virginia had a tax capacity of \$969 per capita in 1981 (30t), in the nation), 6 percent below the national average of \$1,030. Tax capacity was lower than the U.S. average for selective sales, corporate income, and commercial property.

Virginia's tax effort was also below the national average by 10 percent, with a state rank of 31st. The state taxed selective sales and individual income above national average rates for additional income of \$325 million. This was more than offset by taxing general sales, corporate income, and property taxes at levels below the national rates, for a combined loss of \$807 million in potential revenues. The combination of nearly average capacity and low effort resulted in collected tax revenues of \$867 per capita, 16 percent below average, ranking Virginia 34th in the nation in tax funds available to support public services.

Virginia allocated 11.8 percent of its tax revenues to higher education, above the national average of 10.5 percent flow revenues, however, resulted in per capita appropriations of \$102.70 for institutional support, student aid, and other support, 5 percent below average, ranking Virginia . 6th in the nation.

If the total operating budget of Virginia (including nontax and federal revenues) is considered, higher and elementary/secondary education and highways received a larger share of the budget relative to national average allocations. Public welfare and health and hospitals received a proportionately smaller share

#### Higher Education Enrollments

In FY82, Virginia had 34 residents per 1,000 population attending college somewhere, equal to the national average. A relatively high proportion, 85 percent, attended public institutions within the state, 9 percent attended independent institutions in state, and 6 percent attended out-of-state institutions. The national distribution was 73 percent, 18 percent, and 9 percent respectively.

The 69 colleges and universities in Virginia enrolled 210.811 FTE students in fall 1981. The public system, consisting of 39 institutions, enrolled 179,213 (85 percent) of the students, a larger share than average. University enrollment, as a share of the public total, was near the national level (335 versus 321 percent). Four-year college enrollment was proportionately slightly larger (318 versus 283 percent), while two-year college enrollment was smaller (346 versus 378 percent). The 30 independent institutions in the state enrolled only 31,598 FTE students in fall 1981, a relatively small share.

In FY82, Virginia had an average number of high school graduates per 1,000 population compared to the nation, but only 38.4 percent entered public institutions in the state, far below the national rate of 62.5 percent. In-migration of nonresident students was 25 percent greater than the national average. Student retention at public institutions was very high, while full-time enrollments were average. In the independent sector, residents made up 52 percent of the enrollment, below the national level of 60 percent.

#### Institutional Finances and Characteristics

One-third of Virginia's public students enrolled in the state's four universities. Each is well funded by the state, particularly Virginia Common wealth University, which received appropriations that were 32 percent above average for universities with medical programs (ranked 1st among 16 states). With high revenues from private efficient and grants and other sources, the medical university could afford to charge lower tuition than average. Total operating budgets at all four categories of universities were equal to or above the national average for similar schools.

The state's six comprehensive colleges, enrolling 47,558 students, received appropriations that were 28 percent below average. Similarly, public support of the state's 24 two-year colleges, enrolling 61,983 students, was about 25 percent below average.

Corresponding to the unevenness in state support, instructional expenditures per student were above average at the four universities but below average at the other public institutions. Academic support per student was above average at all public institutions except at the comprehensive colleges. Faculty salaries were generally near average except at the two-year colleges, where they were about 15 percent lower than typical.

Most students in the private sector were enrolled at the state's 4 comprehensive and 19 baccalaureate colleges. Both types of institutions were well funded. The comprehensive colleges had strong endowment income, and the baccalaureate colleges obtained substantial funding through private gifts and grants. Expenditures for instruction and academic support were at or above the national average, while expenditures for research per faculty member were low.

1981-82

Additional St to and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	\$ 11,709,300
Postsecondary vocational technical education	<b>\$</b> 0
State boards and CORRESSIONS	\$ 6,006,225
Retirement benefits (including social security)	<b>\$</b> 0
Fringe benefits	<b>\$</b> 0
Interstate contracts and reciprocity payments	<b>\$</b> 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	\$ 611,287
Centrally administered capital/debt service	<b>\$</b> 0
Other (Eniment Scholars Program and Maintenance of Excellence Program)	8 1,969,400

#### Clarification of Institutional financial Reporting

These funds have been included in the MEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Oebt service that is part of state and local \$ 13,600,000 (estimate) appropriations to public institutions in the state

Eurrent funds revenues dedicated to capital purposes:

- tuition and fees \$ 0
   auxiliary enterprises \$ 0
   other
- Tuition and Fees reappropriated by the state? A

#### Other Connents

Figure 1 Turbin and fee revenue is appropriated to institutions as a non-general fund component. Virginia institutions separately identify actual student revenue via NCES form 2300-4.

### WASHINGTON

#### Recent Trends

Washington's public higher education institutions faced some of the most restrictive funding conditions in the U.5 both in FY82 and for the four-year period between FY78 and FY82. Despite significant increases of 11.5 percent in tuition levels in the state, the erosion of state funding support created an FY82 loss of 10.2 percent in total funding and a four-year loss of 6.2 percent. In FY82 after adjustment for inflation and enrollment shifts, state appropriations in constant dollars per student dropped 14.7 percent. Only one other state (Wyoming) saw the purchasing power of state funds slipping more dramatically. While the four-year (FY78 to FY82) profile for Washington is less severe (with a purchasing power loss of 6.2 percent), it still shows a loss that is nearly three times more than the U.S. average loss in spending power of 2.3. percent.

All categories of public institutions were impacted, with total revenue losses per student adjusted for inflation ranging between 2 4 and 17.4 percent in FY82 and between 19 and 16 6 percent for the FY78 to FY82 period. The two-year sectors had the smallest four-year loss but the largest losses in FY82. The greatest four-year losses were in the comprehensive and general baccalaureate sectors (116 and 166 percent respectively). The research iniversity experienced losses in purchasing power of 24 percent in FY82 and 49 percent for the four-year period. In a dramatic contrast, the private sector benefited from revenue gains in both FY82 and for the four-year period, by 48 and 102 percent respectively.

#### State Financing of Higher Education

Despite these dramatic losses in state funding, tax contributions per capita for higher education in Washington were 7 percent greater than average in 1982, even though the level of tax revenues collected in the state was 9 percent lower than the U.S. average. This is because Washington lawmaker, allocate a much larger than average share of the state's buiget to higher education. Washington spent \$115 per capita for higher education in 1982 as compared to the U.S. average rate of \$108 per capita

Of the \$115 spent on higher education, the state channels \$107 to the public institutions in the form of appropriations, spends \$5 on other functions (primarily vocational education), and spends the remaining funds on state student aid for students at both public and private institutions. The state allocates an above-average share of these higher education funds to institutions and provides about half as much for student aid as the average state

#### State Tax Base and Budget

Washington has an average capacity to raise taxes but underutilizes that capacity by 8 percent. Tax revenues collected are therefore below the U.S. average (index 91). Washington's tax capacity is strongest in individual income, residential property, general sales, and licenses. Its tax structure is heavily weighted toward sales—tax categories—both general sales, where it has the second—highest rate in the U.S., and selective sales, where it has the fourth—highest rate. The state collects no income taxes, neither personal nor corporate. Property taxes in the state are also lower than average. Tax rates related to death and gift transfers (Washington ranks 7th) are substantial

Although revenues from these tax sources are 9 percent below average, when total state resources are combined (including federal revenue-sharing funds), the state's total budget is 8 percent larger than average. Higher education receives an 11.3 percent share of that budget, a share 18 percent above average. Highways, public services, and elementary/secondary education are also favored state activities, at the expense of public welfare, health and hospitals, and other services. Although higher education receives an above-average share of a larger than average state pie, its share of the state budget declined from 1978 (when it received 12.5 percent) to 1982 (when it received 13 percent).

#### Higher Education Enrollments

Washington's financial commitment to higher education has provided a level of access to public higher education afforded by very few other states. Residents of Washington are 18 percent more likely to participate in higher education than average. Forty FTE students for every 1,000 individuals in the state are enrolled in a college or university, compared to the 34 per 1,000 averaged nationally. Only two other states provide more access for residents than Washington; four states provide the same level. In Washington, access to higher education is directly tied to public-sector enrollments, and approximately 40 percent fewer Washington residents than average attend private schools in the state or go to other states seeking higher education. As a consequence, this impressive level of access is carried by the state. Enrollments in the public sector (both resident and nonresident) are 37.3 FTE per 1,000, a level 28 percent higher than average. More than half of these students (54 percent) attend one of the 27 community colleges in the state, a very large share compared to other states. The comprehensive and baccalaureate sectors are smaller than average, and

university-level enrollments are just below average. Washington's student population is less graduate as a whole because of the emphasis on the two-year sectors, and the system is therefore less expensive to run.

#### Institutional Finances and Characteristics

Although Washington's appropriations per capita for public higher education institutions are 10 percent above the average, the state spreads these funds over a pool of students that is nearly 30 percent larger than usual. As a result, state appropriations per student in Washington are 13 percent below average. And most categories of public institutions (except the single public baccalaureate institution, Evergreen State) receive below-average state support. The research universities are the most underfunded by the state, operating with 16 percent less per student than their counterparts in other states. State funding in other public sectors is 2 to 9 percent below average. Reflecting the recent declines in state funding, the share of institutional budgets carried by the state fell from 57 percent in FY78 to 52 percent in FY82.

Revenues from other sources further exacerbates this profile. Despite relatively large increases in recent years, tuitions are quite low in the public sector (24 percent below average), and consequently, the total revenues per student are 14 percent below the national average. From 1978 to 1982, the medical research universities found their state-funds index of 89 falling to an 'index of 83 (17 percent below average) in terms of total funding (excluding government grants and contracts). Similar declines are evident in the other sectors.

Surprisingly, faculty salaries kept pace with national patterns between 1978 and 1982, putting them close to or above national averages in all public sectors in the state. However, there are clear variations by rank. Salaries for full professors are below average in all cases, while those for the lower ranks are close to or above average.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the inetitutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts stoum on the first data page are shown in per capita terms.)

Student Aid	\$ 9,357,610
Postsecondary vocational technical education	\$ 20,976,000 (9,561 FTL)
State poards and compissions	\$ 2,215,000
Retirement benefits (including social security)	<b>\$</b> 0
fringe benefits	\$ O
Interstate contracts and reciprocity payments	\$ 209,000
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	<b>\$</b> 0
Centrally administered capital/debt service	<b>\$</b> 0
Other	\$ 0 ·

#### Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current funds revenues dedicated to capital purposes:

\$ 18,452,000 - tultion and fees f not available - auxiliary enterprises - other

fultion and Feee reappropriated by the state? Yes

Other Connents

(Indexes shown in bold are based on U.S. average = 100)

### **WEST VIRGINIA**

#### Recent Trends

The overall funding of public higher education in West Virginia improved remarkably between 1978 and 1982 despite funding losses in fiscal years 1982 and 1981. During these four years, appropriations increased 70.1 percent, the 6th-highest increase in the nation. With below-average enrollment growth and an inflation rate of 44 3 percent (HEPI), appropriations per student in constant dollars gained 13.9 percent, in contrast to a national average loss of 5.3 percent. Institutions also increased tuition revenues a signficant 2.4 times the national average during the four years. This represented a 65.8 percent increase in constant dollars, highest in the nation. As a result, total educational and general revenues per student in constant dollars increased 16.2 percent, 3rd-highest increase in the nation. However, the increases were distributed unevenly among different types of public institutions. West Virginia University, classified as a research university with medical program, obtained a 63.4 percent funding increase in adjusted dollars between 1978 and 1982, while the two-year sectors registered small real gains. All other categories ', public institutions, however, had losses between 15 to 16 percent. Faculty salaries increased 40 percent during this period, less than the 50.2 percent change in the CPI. This resulted in a 7 percent loss in purchasing power.

Enrollment at the state's 11 independent institutions increased 9 percent from 1978 to 1982, compared to the 106 percent national average increase. Tuition kept pace with inflation, and there were sizable increases in revenues from other sources. As a result, total educational and general revenues per student in constant dollars increased 110 percent. Faculty salaries increased 35 percent. representing a 10 percent loss in purchasing power

#### State Financing of Higher Education

In FY82, West Virginia's public higher education system was 9 percent smaller than average for the nation and enrolled 26 6 FTE students per 1,000 population, compared to the national average of 292 students per 1,000 population. Total per capita appropriations of \$93.10 for higher education were 14 percent below the national average. As a result, appropriations per student of \$3,098 were 7 percent below average, ranking the state 30th in the nation. Low revenues from tuition and other sources resulted in total funding per student that was 14 percent lower than the national average.

The state appropriated \$1.40 per capita for student financial aid, compared to the U.S. average of \$4.20 per capita. Independent institutions in West Virginia received no state support. State boards and commissions received \$1 million for their operations.

#### State Tax Base and Budget

West Virginia's potential tax wealth was \$926 per capita in 1981 (35th in the nation), 10 percent below the national average of \$1,030. The state had below-average capacity in general and selective sales, individual and corporate income, and residential and farm property.

West Virginia's tax effort was 17 percent below the national average, with a state rank of 41st. The state taxed corporate income at 69 percent below national rates, for a loss of \$71 million in potential income; property was taxed at 49 percent below national rates, for a loss of \$279 million. The combination of low tax capacity and low tax effort resulted in collected tax revenues of \$770 per capita, 25 percent below average. This placed West Virginia 42nd in the nation in tax funds available to support public SETVICES.

West Virginia allocated a high 12.1 percent of its tax revenues to higher education, compared to the national average of 10.5 percent. Due to low tax revenues, however. this allocation resulted in per capita appropriations of only \$93.10 for institutional support, student aid, and other support. This amount was 14 percent below average and ranked West Virginia 35th in the nation.

If the total operating budget of West Virginia (including nontax and federal revenues) is considered, highways and elementary/secondary education received a larger share of the budget relative to national average allocations. Higher education, public welfare, and public services all received a proportionately smaller share.

#### Higher Education Enrollments

In FY82, West Virginia had 26 residents per 1,000 population attending college, well below the national average of 34 per 1,000 population. Access was below average both in and out of state.

The 27 colleges and universities in West Virignia enrolled 60,981 FTE students in fall 1981. The public system, consisting of 16 institutions, enrolled 51,931, or 85 percent of the students compared to 76 percent nationally. University enrollment, as a share of the public total, was nearly equal to the national level (33.5 versus 32.1 percent). Four-year college enrollment was proportionately much larger (54.3 versus 28.3 percent), while two-year college enrollment was much smaller (9.5 versus 37.8 percent). The 11 independent institutions in the state enrolled 9,050 FTE students in fall 1981, representing only 15 percent of students in the state.

In FY\$2. West Virginia had slightly fewer high school graduates per 1,000 population than the national average. Only 43.7 percent entered the state's public institutions. well below the national rate of 62.5 percent. In-migration of nonresident students was 2.4 times the national average Student retention was high, while full-time enrollments were average. In the independent sector residents made up 47.3 percent of enrollments, above the national level of 60 percent.

#### Institutional Finances and Characteristics

West Virginia University, with 17,406 students, received appropriations that were 8 percent below average. Low revenues from tuition and other sources resulted in total educational and general revenues per student that were 19 percent below average for research universities with medical programs.

Marshall University, which enrolled 8,482 students, is the state's only comprehensive college. It received an even lower amount of state support, with appropriations 31 percent below average. Tuition revenues were also low, 30 percent below average. As a result, total educational and general revenues per student were 33 percent below average.

The state's eight baccalaureate colleges, with a combined enrollment of 19,755 students, fared even worse because of low state support and tuition revenues 63 percent below the national average. Total educational and general revenues per student for these institutions were 34 percent below average, worst in the country.

Instructional expenditures at West Virginia University were 23 percent below average. At Marshall University they were 37 percent below average, and at the baccalaureate colleges they were 29 percent below average. Both West Virginia University and the baccalaureate colleges conducted public-service programs with above-average funding per capita. Faculty salaries for all types of public institutions in West Virginia were below average.

The seven independent baccalaureate colleges in the state received tuition revenues that were \$ percent below average and obtained total educational and general revenues per student that were 9 percent below the national average. Although instructional expenditures were nearly average, faculty salaries were 13 percent below average.

1981-82

Additional State and Local Government funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Rid	\$ 2,731,862
Postsecondary vocational technical education	<b>\$</b> 0
State boards and commissions	8 1,004,670
Retirement benefits (including social security)	<b>\$</b> 0
Fringe benefits	\$ 16.650,000 (estinate)
Interstate contracts and reciprocity payments	\$ 684,451
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	
Centrally administered Capital/debt service	المستعملين المستعملين
Other	<b>\$</b> 0

#### Clacification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local appropriations to public institutions in the state

Current Funds revenues dedicated to capital purports:

- . tuitien and fees - auxiliary enterprises
- 8 16,316,8054

Tuition and Fees reappropriated by the state? No

Other Connents

* Not clear whether imetitutions report this figure to HEGIS.

### **WISCONSIN**

#### Recent Trends

In FY82, increases in both state appropriations and tuition in Wisconsin trailed inflation, creating a loss of 1.6 percent in the purchasing power of total revenues per student (excluding government grants and contracts). Thus for the third year in a row, the value of funding for public higher education in Wisconsin declined. The combined effect of these losses meant that between 1978 and 1982, the constant-dollar value of state support per student fell 12.9 percent and the total revenue base dropped 10.1 percent. Losses of this magnitude placed public higher education in Wisconsin in some of the most difficult financial circumstances seen among the states. Only four other states in the nation (Iowa, Michigan, Montana, and Wyoming) had to contend with more restricted financial conditions.

No category of public institutions was spared. Losses between 1978 and 1982 in state support adjusted for inflation ranged between 6.2 percent and 20.2 percent. In total funding the range was smaller but significant, from 4.3 percent to 17.0 percent. Declines at the medical research university (University of Wisconsin—Madison) and the nonmedical university (University of Wisconsin—Milwaukee) were 10.6 and 10.7 percent respectively. The ten comprehensive institutions saw their funding base decline by 13.3 percent. The large two-year occupational sector faced losses of 4.3 percent, the lowest of any sector.

In contrast, the independent sector saw its overall spending power improve both in FY82 (by 5.1 percent net of inflation) and for the FY78 to FY82 period (by 8.4 percent). These improvements were evident in most categories of independent schools.

According to census figures, the proportion of the state budget allocated to higher education fell from 12.5 percent in 1978 to 12.0 percent in 1982. Despite this slippage, in 1982 Wisconsin still allocated an above-average share of its budget to higher education, and its per capita expenditures for public higher education ranked 6th in the nation.

#### State Financing of Higher Education

Wisconsin spent \$149 per capita for higher education in FY82, an amount 38 percent greater than the national average. Ninety-two percent of this expenditure went toward general support of institutions, with student aid receiving 3 percent. The public sector received 97.5 percent of the state's expenditures for higher education. Of the share going to private higher education, two-thirds was for student aid and one—third was for institutional support

#### State Tax Base and Budget

Wisconsin raised \$1,126 per capita in state taxes, 9 percent more than the U.S. average. Although Wiscontin's inherent tax wealth is 9 percent below average, the state has a high 488

tax rate (ranking 7th nationally), which accounts for the state's large pool of tax revenues. Through strong tax efforts in both individual income tax (the state ranks 2nd among the states in this category) and property taxes (with a rank of 15), the below-average inherent wealth is overcome and an above-average pool of tax revenues is achieved by the state.

Elementary/secondary education receives 27.1 precent of the state budget (the largest portion), followed by 16.4 percent for other services and 13.0 percent for public services. Higher education and public welfare both receive about 12 percent of the budget, and highways receive 10.0 percent. Public welfare and other services are most underfunded as compared to the U.S. average. Although the portion going to higher education declined to 12.0 percent in 1982 (from 12.5 percent in 197%), that allotment was still 25 percent greater than the average higher education budget share.

#### Higher Education Enrellments

Wisconsin residents are far more likely to attend higher education institutions than are residents of other states. Forty residents per 1,000 are enrolled, a level 18 percent above typical access levels. The state's public institutions accommodate the bulk of these students, educating 34 residents per 1,000 capita, a number 34 percent above average. As a consequence of this emphasis on enrollment in the state's public institutions, Wisconsin residents seeking a college education are less likely to enroll in private schools within the state (index 72) or at out-of-state institutions (index 69).

Although Wisconsin residents do not generally migrate to other states for higher education, a substantial number of students from other states, 30 percent more than the average number, do come to Wisconsin. The high resident enrollment, combined with large numbers of nonresidents, results in a heavily enrolled public sector—a system with almost 30 percent more students than average. This large number of students creates a significant funding load for the state.

Although there are 33 private institutions, compared to 30 public institutions, 86 percent of the total enrollment is in the public sector. Of the public students, 32 percent are enrolled in universities, 37 percent attend comprehensive institutions, and 30 percent attend two-year institutions. This pattern is fairly typical, except for the concentration in comprehensive institutions, which is well above average. The University of Wisconsin—Madison (medical research university) enrolls a larger than average number of graduate students as compared to similar institutions—26 percent versus 21 percent—thus creating additional funding needs for the campus. As for private enrollments, 48 percent of the students are concentrated in baccalaureate institutions, and 35 percent attend the medical university (Marquette University).

Public enrollments rose by nearly 10 percent from 1978 to 1982, and there was a similar rise (10.2 percent) in the private sector. With 208,527 FTE students, Wisconsin's total enrollment in higher education is the 13th pargest in the nation.

#### Institutional Finances and Characteristics

In terms of total E&G revenues (excluding government contracts), public institutions in Wisconsin receive per-student funding that is 5 percent above national levels. This is largely the result of above-average state funding (index 108) and tuition revenues (index 122). However, the distribution of these funds is quite uneven, and three sectors function with below-average funding (from 6 to 9 percent) while three others receive \$ to 62 percent more than similar institutions elsewhere. The largest sector, the comprehensives, is the most underfunded compared to national averages and operates with 9 percent less per student than the norm. The University of Wisconsin -- Madison obtains 6 percent less in operating support than average and, in addition, has greater expenses due to its above-average emphasis on graduate education. The University of Wisconsin -- Milwaukee receives revenues that are below average (by 9 percent), but it is much less graduate in orientation than other nonmedical universities. The two-year occupational schools are the best funded and function with 62 percent more in funds than the average for this sector. The academic two-year schools secure \$ percent more funding than average. The one public baccalaureate institution in the state has a pool of funds to support general operations that is 19 percent larger than the average.

Total revenues for institutions in the private sector are 5 percent better than average, although there are major variations in funding among different types of institutions. Only Marquette University functions with significantly below-average funding.

Faculty salaries in Wisconsin are close to national levels in the public sector but are 8 percent below average in the private sector. Although Wisconsin's increases in faculty salaries from 1978 to 1982 were close to national rates, differences by rank were evident; in comparison with similar faculty elsewhere, faculty in the lower ranks fared better than did full professors. The average size of public institutions in Wisconsin is generally substantially larger than usual (index 132). Presuming some economies of scale, funding needs are reduced somewhat.

1981-82

Additional State and Local Government Funding for Higher Education - Current Operations

Only state and local funds not reported by the institutions through the HEGIS institutional finance report are shown here. The amounts shown below are included in the State and Local Government Support of Higher Education section on the first data page for your state. (The dollar amounts shown on the first data page are shown in per capita terms.)

Student Aid	\$ 21,345,000
Postsecondary vocational technical education	<b>8</b> 0
State boards and conmissions	\$ 6,092,200
Retirement benefits (including social security)	<b>\$</b> 0
fringe benefits	<b>\$</b> 0
Interstate contracts and reciprocity payments	<b>\$</b> 0
Service functions provided centrally (e.g., computer service, library, telephone, etc.)	8 0
Centrally administered capital/debt service	<b>8</b> 0
Other (University extension)	\$ 29,020,900

## Clarification of Institutional Financial Reporting

These funds have been included in the HEGIS reports but are noted here to clarify differences in practices among the states that affect the comparability of these data.

Debt service that is part of state and local \$ 43,163,300 appropriations to public institutions in the state

Current Funds revenues dedicated to capital purposes:

# **WYOMING**

#### Recent Trends

Wyoming's appropriations to public higher education fell 21.4 percent in fiscal year 1982. When inflation and an enrollment gain of 5.3 percent are factored in, state funding declined by almost one—third. No other state in the nation experienced more difficult funding circumstances. Increases in tuition revenue also lagged behind inflation. The combined result was a 24.1 percent per student constant—dollar reduction in the operating base of public institutions, worst in the nation. Most of this reduction was absorbed by the University of Wyoming (university without medical), which experienced a loss of 37.3 percent. Laramie County Community College, the state's two-year occupational school, saw its funding fall by 4.3 percent. Surprisingly, the academic two-year schools had an 8.0 percent improvement in support.

Wyoming was 2nd in the nation in increased state appropriations to higher education from 1977 to 1981. However, between 1978 and 1982, with 8.6 percent enrollment growth and 44.3 percent inflation (HEPI), appropriations per student in constant dollars declined 26.6 percent, the worst decline in the nation. Tuition revenues also did not keep pace with inflation, declining 10.5 percent in constant dollars. Thus, total educational and general revenues per student in constant dollars declined 20.0 percent, again ranking Wyoming last in the nation.

Faculty salaries increased 42 percent between 1978 and 1982, not enough to keep up with the 50.2 percent increase in the CPI. As a result, faculty purchasing power fell 5 percent.

#### State Financing of Higher Education

Wyoming operates a larger public higher education system than average relative to its population and in FY82 enrolled 31.4 FTE students per 1,000 population, compared to the national average of 29.2 per 1,000 population. Total per capita appropriations of \$127.10 for higher education were 18 percent above average, ranking the state 11th. As a result, appropriations per student of \$4,021 were 21 percent above average, ranking Wyoming 6th in the nation in this measure. Public institutions received low tuition revenues but substantial funding from private gifts and grants and from other sources. Thus, total funding per student was 27 percent above average. This financial profile is impressive, given the losses that were sustained between 1978 and 1982.

The state provided no appropriations for student financial aid. State boards and commissions received \$102,000 in state support, and centrally provided service functions received \$253.000.

#### State Tax Base and Budget

Wyoming has a very high tax potential and had a tax capacity of \$2,228 per capita in 1981, 2nd highest in the nation. This was 116 percent above the national average of \$1,030. The state had above-average capacity for all types of taxes, with the potential for severance-tax revenues being 21 times the national average.

Wyoming's tax effort, however, was 27 percent below the national average, ranking the state 49th in the nation. The state did tax general sales and property above national rates. However, Wyoming has no individual income or corporate income tax, in 1981 losing an estimated \$195 million in potential revenues as a result. Also, severance taxes were 59 percent below the national average, with a resulting revenue loss of \$198 million. Despite the low effort, the extremely high tax capacity yielded collected tax revenues of \$1,615 per capita, 57 percent above the national average. As a result, Wyoming ranked 3rd in the nation In tax funds available to support public services.

In 1982, Wyoming allocated 7.9 percent of its tax revenues to higher education, well below the national average of 10.5 percent. In 1981, 13 percent was allocated. Despite the low allocation rate, high tax revenues created total appropriations of \$127.10 per capita for higher education, 18 percent above average and 11th in the nation. In 1980, state appropriations to higher education were 67 percent above average, ranking the state 2nd in the nation.

If the total operating budget of Wyoming (including nontax and federal transfers) is considered, highways, elementary/secondary, and higher education received larger shares of the budget relative to national average allocations. Public welfare and health and hospitals received proportionately smaller shares.

#### Higher Education Euroliments

In FY 82, Wyoming had 32 residents per 1,000 population attending college somewhere, just 5 percent fewer than was typical nationally. The national average was 34 students enrolled per 1,000 population. Since Wyoming has no independent institutions, a relatively high proportion of state residents, 91 percent, attended public institutions within the state; 9 percent attended out of state.

The eight public colleges and universities in Wyoming enrofled 15,491 FTE students in fall 1981. The public system is above average in size relative to the state's population. University enrollment, as a share of the public total, was proportionately much larger than the national mix (56.3 versus 32.1 percent). Wyoming has no

institutions classified as four-year colleges by this study. Two-year college enrollment was proportionately much larger than the national mix (43.7 versus 37.8 percent).

In FY\$2, Wyoming had a nearly average number of high school graduates per 1,000 population compared to the nation. An above-average proportion, 67.2 percent, entered public institutions; the national entrance rate was 62.5 percent. In-migration of nonresiden, students was 2.6 times the national average. Student retention at public institutions was low, while full-time enrollments were average.

#### Institutional Finances and Characteristics

The University of Wyoming enrolled over half of the public students in the state. In 1981, the state appropriated \$6,282 per student to the university, twice the national average. In 1982, appropriations of \$3,294 per student equaled the national average. Tuition revenues at the university were low, 17 percent below average, while private gifts and grants and other revenues were 3.8 times the national average. As a result, total educational and general revenues per student at the university were 28 percent above the national average. The expenditure pattern of the university was correspondingly high. Public—service expenditures per 1,000 capita were 18 times the national average.

The six public two-year academic colleges in Wyoming received 2.4 times the national average in state funding (ranked 2nd among 46 states). Instructional expenditures of \$2,882 per student were ranked 2nd highest in the nation.

& Specialized

# APPENDIX A: LISTING OF INSTITUTIONS BY CLASSIFICATION, CONTROL, AND STATE

# Description of the Institutional Classification System

Most earlier studies of higher education financing have used a three-category institutional classification system--university, four-year, and two-year institutions--prompted largely by the use of these categories by the National Center for Education Statistics (NCES). Given the substantial differences among higher education institutions in terms of their relative emphasis on different levels and fields of study and the implications of these differences for financial comparisons, this study uses a more detailed classification, based on ten different institutional categories, plus a distinction between the public and private/independent sectors.

This classification procedure was developed by NCHEMS, and is modified here to identify separately doctoral institutions that offer first-professional health science programs (that is, medicine, dentistry, osteopathy, and veterinary medicine). NCHEMS uses an explicit set of empirically based criteria that are applied objectively by competer analysis to identify each institution's category.

## The criteria are based on:

- The number of degrees earned, by type of degree (associate, bachelor's, master's, doctorate, and first professional) as an indication of the institution's commitment to the levels of education of fered (for example, postbaccalaureate, undergraduate).
- The number of fields in which degrees were earned. This measure is an indication of the diversity of program of terings at an institution.

- The ratio of degree completions in several specific fields to total degree completions. This is an indication of program emphasis at an institution.
- Research expenditures as an indication of the centrality of research activities to the mission of a campus.
- For the purposes of this study, an additional criterion was used to distinguish whether medical-related activities were an integral part of the educational mission of the institution. The granting of professional doctoral degrees in the fields of medicine, dentistry, osteopathic medicine, or veterinary medicine places campuses in the category "with medical" as contrasted to "without medical." This criteria was applied only to universities (that is, research universities and universities).

This classification process uses the Higher Education General Information Survey (HEGIS) data on degrees and finances, which were obtained from NCES. Only those institutions reported in the HEGIS universe are included. Many nonresponding single-program occupational schools are therefore not included in this universe.

In identifying "campus units" for classification, the study relied on the reporting units used by NCES in the HEGIS surveys. This caused some problems for branch campuses that were separately classified based on their own degree-granting activities and not on the basis of those at the parent institution. Several institutions reported enrollment and financial data but did not report degrees conferred. These institutions were and classified into appropriate categories cased upon input from their respective state agency and judgment as

to where such institutions belonged in the classification scheme. In addition, several other institutions reporting degrees conferred were hand classified because of the unique nature of the institution (for example, Rockefeller University in New York and the Georgia Institute of Technology).

The major categories in the NCHEMS institutional classification system and numbers of institutions by category and control in this study are:

Categories of Institutions	Public	Independent
Research univ., medical	33	18
Research univ., nonmedical	17	6
University, medical	17	12
University, nonmedical	46	30
Comprehensive	258	166
General baccalaureate	113	579
2-year academic & comprehensive	627	115
2-year occupational	328	220
Health professional	31	22
Other professional & specialized	34	475
Total	1,507	1,643

The criteria used in classifying institutions by these categories are as follows:

## Research Universities

These institutions are characterized by a significant level of activity in and commitment to doctoral-level education as measured by the number of doctorate recipients and the diversity in doctoral program offerings and by engaging in a significant level of research activities. To be classified as a research university, an institution must grant a minimum of 30 doctoral-level degrees in three or more doctoral-level program areas I on an annual basis or, alternatively, have an interdisciplinary program at the doctorate level. Included in the counts of doctorate degrees are the first professional (M. D. D. D., D. V. M., D. D. S.). In addition to meeting the criteria on degrees, a research university must rank among the top 75 institutions in the country in research expenditures. For this study, exceptions have been made to include Rockefeller University and Georgia Institute of Technology Main Campus in this category because of their doctoral program emphasis and substantial level of research; thus, there are 77 research universities used in this study.

#### Universities

These institutions meet all of the criteria stated above, except they are not as significantly involved in research activities as the research universities.

## Comprehensive Institutions

These institutions are characterized by a strong, diverse postbaccalaureate program (including first professional) but do not engage in significant doctoral-level

education. Specifically, this category includes institutions not considered specialized schools in that the number of doctoral-level degrees granted is less than 30 or in that fewer than three doctoral-level programs are offered. In addition, these institutions must grant a minimum of 30 postbaccalaureate 2 degrees and either grant degrees in three or more postbaccalaureate programs, or alternatively, have an interdisciplinary program at the postbaccalaureate level.

#### General Baccalaureate Institutions

These institutions have, as their primary emphasis, general undergraduate, baccalaureate education. They are not significantly engaged in postbaccalaureate education. Included are institutions not considered specialized institutions, in which the number of postbaccalaureate degrees granted is less than 30 or in which fewer than three postbaccalaureate level programs are offered, but either (a) grant baccalaureate degrees and grant degrees in three or more baccalaureate programs, or (b) offer a baccalaureate program in interdisciplinary studies. Additionally, over 25 percent of the degrees granted must be at the baccaluareate level or above.

## Two-Year Institutions

Institutions that confer fewer than 25 percent of their degrees at the baccalaureate or postbaccalaureate level, and that confer over 75 percent of their degrees or awards for two years of work, or formal awards and completions requiring less than two years of work, are considered two-year institutions. Institutions with a two-year upper division program would not fall in this category because they grant baccalaureate degrees.

- (1) Academic/Comprehensive: Institutions in which the number of degrees awarded in the academic area (5600 field in the HEGIS Taxonomy) is at least 20 percent of all degrees awarded.
- (2) Occupational: Institutions in which degrees or awards in two or more occupational programs are conferred and that grant less than 20 percent of their degrees in the academic area (5600 field in the HEGIS Taxonomy).

## Health Professional Institutions

Institutions in which health science education is the primary objective and that confer first-professional medical degrees such as M. D., D. O., D. D. S., and D. V. M. constitute medical institutions. These institutions are those (a) in which the number of professional health science degrees (medicine, dentistry, optometry, pharmacy, and so on) granted plus the number of other health science degrees (1200 field in the HEGIS Taxonomy) exceeds 60 percent of all degrees awarded. or alternatively, in which the number of such degrees awarded exceeds 50 percent of all degrees awarded and the number of baccalaureate programs offered is fewer than five, and (b) in which one of the following first-professional medical degrees is conferred: M. D., D. D. S., D. O., or D. V. M.

# Other Professional and Specialized Institutions

This category includes a diverse group of specialized institutions. For purposes of the study, they have been collapsed into a single category. The more detailed distinctions are:

Programs or program areas are a major field of study as defined at the two-digit level of the HEGIS Taxonomy of Programs.

2Includes master's doctoral, and first-professional degrees.

- (1) Other Health Institutions Institutions in which health science is the primary objective but that do not confer an M. D., D. D. S., D. O., or D. V. M. These institutions are those that satisfy criterion (a) above, but do not award any one of the following first-professional medical degrees: M. D., D. D. S., D. O., or D. V. M.
- (2) Education Schools Institutions in which over 60 percent of the degrees are conferred in education (0800 field in the HEGIS Taxonomy), or alternatively, in which the number of such degrees awarded exceeds 50 percent of all degrees awarded and the number of baccalaureate programs offered is fewer than five.
- (3) Engineering Schools Institutions in which either the number of degrees awarded in the area of engineering (1900) field in the HEGIS Taxonomy) exceeds 60 percent of all degrees awarded, or alternatively, in which the number of such degrees awarded exceeds 50 percent of all degrees awarded and the number of baccalaureate programs offered is fewer than five.
- (4) Divinity Institutions Institutions in which either the number of professional theological degrees plus the number of other degrees granted in theology (2300 field in the HEGIS Taxonomy) exceeds 6() percent of all degrees awarded, or alternatively, in which the number of such degrees awarded exceeds 50 percent of all degrees awarded and the number of baccalaureate programs offered is fewer than five.

- (5) Business and Management Schools Institutions in which over 60 percent of
  the degrees are conferred in the area of
  business and management science (0500
  field in the HEGIS Taxonomy), or
  alternatively, in which the number of
  such degrees awarded exceeds 50
  percent of all degrees awarded and the
  number of baccalaureate programs
  offered is fewer than five.
- (6) Art, Music, and Design Schools —
  Institutions in which over 60 percent of
  the degrees are conferred in the area of
  art, music, and/or design (1000 field in
  the HEGIS Taxonomy), or alternatively,
  in which the number of such degrees
  awarded exceeds 50 percent of all
  degrees awarded and the number of
  baccalaureate programs offered is fewer
  than five.
- (7) Law Schools Institutions in which either the number of professional law degrees (L. L. B. or J. D.) plus the number of other degrees awarded in law (1400 field in the HEGIS Taxonomy) exceeds 60 percent of all degrees awarded, or alternatively, in which the number of such degrees awarded exceeds 50 percent of all degrees awarded and the number of baccalaureate programs offered is fewer than five.
- (8) Other Specialized or Professional Schools Institutions that grant degrees in fewer than three programs at the baccalaureate level, master's level, and the doctorate level and do not confer over 50 percent of their degrees in any of the above categories.
- (9) U.S. Service Schools Although these schools are separately categorized here, they were excluded from the study.

There follows a listing of all campuses included in this study, by institutional category and state. The states are shown in alphabetical order. The institutions listed include campuses that reported HEGIS data to NCES during the years FY78 through FY82.

# APPENDIX B: DATA SOURCES AND CAUTIONS

# Section One: Data Sources and Definitions

To facilitate the cross-reference of data sources with the state profiles, the attached data-sources information is referenced on a page-by-page basis for the seven data pages.

## FIRST DATA PAGE - STATE FINANCING OF HIGHER EDUCATION

Section: State and Local Government Support of Higher Education 1982 (Per Capita)

## Student Aid

Source: NCES. HEGIS XVII: State Expenditures for Postrocondary Education for Fiscal Years Ending 1981 and 1982. Washington, D. C.: NCES, 1983; or special survey of states conducted by the authors in May 1983 entitled, "Survey of Selected State Funding and Financing Practices for Postsecondary Education," Boulder, Colo., 1983.

Funds that are appropriated to and expended for student aid through acts of state and local governments for outright scholarship grants, fellowship stipends, and work-study to individuals enrolled in formal coursework, either for credit or not. These funds are provided directly to students. They do not include state appropriations to institutions for student aid. Includes both merit (academic and athletic) and need-based awards to students at the undergraduate and graduate level attending in-state institutions.

## General Institutional Support

Source: NCES. HEGIS XVII. Financial Statistics of Institutions of Higher

Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

General institutional support is the sum of lines 3 and 4 from Part A. All amounts received from or made available to institutions through acts of state and local legislative bodies, except grants or contracts. These funds are for meeting current operating expenses and not for specific projects or programs.

## Other

Source: NCES. HEGIS XVII. State Expenditures for Postsecondary Education for Fiscal Years Ending 1981 and 1982. Washington, D. C.: NCES, 1983; or special survey of states conducted by the authors in May 1983 entitled, "Survey of Selected State Funding and Financing Practices for Postsecondary Education," Boulder, Colo., 1983.

State and local government appropriations for higher education, excluding those for student aid noted above and institutional appropriations as represented in the HEGIS reporting universe. This category reports other government support for higher education operations not reported through HEGIS. Included are appropriations for operating expenses for postsecondary vocational-technical institutions not listed in the HEGIS universe; support for the operating expenses of postsecondary education coordinating boards, governing boards, boards of trustees, system offices, or similar organizations not reported through HEGIS; certain reciprocity payments to other states; support for the operation of centralized services (library, computing, extension); and state and locally paid fringe benefits and retirement payments that do not flow directly through instructional accounts.

## Total

Source: Derived measure.

The sum of state and local support provided for student aid, general institutional support, and other.

## **Population**

Source: U.S. Bureau of the Census. "State Population Estimates: Revised Methodologies for the 1980's and Illustrative Estimates." In Current Population Reports. 13 September 1983.

Per-capita measures are used throughout the study and utilize these population figures. Estimates of state population are conducted annually by the U.S. Census Bureau and the states under the Federal-State Cooperative Program. The count represents individuals who, at the time of the survey, considered the given place their usual residence. Residence is interpreted here as the place a person lives and sleeps rather than the legal or voting residence

## State and Local Tax Capacity, Effort, and Revenues

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, D. C.: ACIR, September 1983.

See desinitions in section entitled "Tax Capacity and Effort 1981."

## Percent Allocated to Higher Education

Source: Derived measure.

Percent calculated by dividing the total state appropriation by tax revenues.

## State and Local Appropriations to Higher Education Per Capita

Source: Derived measure.

The sum of state and local support provided for student aid, general institutional support, and "other," divided by the state's population. These appropriations are shown separately for public and independent institutions, where state record-keeping practice permits a separate distinction. Where this information is not available, the figures are shown under "not identified by sector."

It should be noted that for this study the HEGIS universe of institutions has been modified in two ways. First, all U.S. service schools such as West Point and the U.S. Air Force Academy have been excluded from the analysis because they do not receive state funds and because their inclusion would dramatically distort state sector averages. Second, all institutions in the U.S. territories (for example, Puerto Rico) are not included because the territories are not "states."

## Section: Enrollments: Fall 1981

## **Population**

Source: U.S. Bureau of the Census. "State Population Estimates: Revised Methodologies for the 1980's and Illustrative Estimates." In Current Population Reports. 13 September 1983.

## Total Enrollment

Source: NCES. HEGIS XVI: Fall Enrollment in Institutions of Higher Education, 1981. Washington, D. C.: NCES, 1981. (Magnetic Tape.)

FTE enrollment figures are based on the sum of full-time men plus full-time women plus an FTE of part-time students

(as reported by institutions)—that is, line 14, columns 13 and 14; and line 28, column 15 on the survey form. (For institutions that do not report the FTE of part-time students, FTE is calculated by summing part-time men and part-time women, and dividing by three.)

## **Enrollment of State Residents**

Source: (1) NCES. HEGIS XVI: Fall Enrollment in Institutions of Higher Education, 1981. Washington, D. C.: NCES, 1981. (Magnetic Tape) and (2) NCES. HEGIS XIV: Residence and Migration of College Students, Fall 1979. Washington, D. C.: NCES, 1979. (Magnetic Tape); or the special survey of states conducted by the authors in May 1983 entitled, "Survey of Selected State Funding and Financing Practices for Postsecondary Education," Boulder, Colo., 1983.

To determine public and independent resident FTE enrollments per 1,000 population, total FTE enrollment was factored by the resident ratios for first-time students. The number of residents attending institutions outside the state are based on first-time student counts from the specific source state. The total is the sum of residents attending public and private institutions in the state plus residents attending out-of-state institutions.

## Section: State and Local Government Direct General Expenditures by Function 1982

## Expenditures by Category

Source: U.S. Bureau of the Census. Governmental Finances in 1981-82. Series GF82, no. 5.

Higher Education - Facilities and activities of all educational institutions beyond the high school level operated by state or local governments, except that agricultural

experiment stations and agricultural extension services are classed under natural resources, and university-operated hospitals serving the public are classed under hospitals.

Elementary/Secondary - Comprises all direct expenditures by local governments for education, other than any direct spending for institutions of higher education, and any direct state government spending for operation of, or facilities and supplies for, elementary and secondary public schools. Also includes all federal expenditures for education, state supervision of schools and colleges, and state tuition grants, fellowships, aid to private schools, and educational programs for the handicapped, adults, veterans, and other special classes.

Highways - Streets, highways, and structures necessary for their use, street lighting, snow and ice removal, toll highway and bridge facilities, and ferries.

Public Welfare - Support of and assistance to needy persons contingent upon their need. Excludes pensions to former employees and other benefits no contingent on need.

Health and Hospitals - Health services, including health research, clinics, nursing, immunization, and so on. Hospitals include the establishment and operation of hospital facilities, provision of hospital care, and support of public or private hospitals.

Public Services - Services for the public, including police protection, fire protection, libraries, sewerage, and natural resources and parks.

Other - Categories include veterans services, air transportation, corrections, housing and urban renewal, governmental administration, interest on debt, and all other general expenditures.

548

## Section: Tax Capacity and Effort 1981

## Tax Capacity

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, D. C.: ACIR, September 1983.

Tax capacity is calculated using a representative tax system. Tax capacity of a state and its local governments is defined as the amount of revenue they could raise (relative to other state-local governments) if all 50 state-local systems applied identical tax rates (national averages) to their respective tax bases. Tax capacity is expressed as an index relative to the U.S. at 100. Tax bases include general sales, selective sales and gross receipts, licenses, individual income, corporate net income, property, death and gift, and severance. For a full description of tax capacity, see the source document.

## Tax Effort

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, D. C.: ACIR, September 1983.

Measures the extent to which tax capacity is actually used, and is expressed as the percentage relation between actual amounts of tax revenues collected by governments compared to tax capacity. Since the nationwide effort measure is 100 percent, the effort values for various states actually indicate how states compare in tax-effort performance to the national average.

## Potential Amounts

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, P.C.: ACIR, September 1983.

The absolute-dollar amount of tax capacity based on the total economic base of state and local governments as measured by the representative tax system.

## Collected Amounts

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, D. C.: ACIR, September 1983.

Compulsory contributions exacted by state and local governments for public purposes. Includes interest and penalties but excludes refunds. Nontax revenues such as fees and charges, special assessments, rents, royalties, fines, interest earnings, and net profits from government-operated electric utilities, gas and water companies, liquor stores, and grain elevators are excluded.

## Over (Under) Utilized Amounts

Source: Advisory Commission on Intergovernmental Relations. 1991 Tax Capacity of the Fifty States, Washington, D. C.: ACIR, September 1983.

The difference between potentia (a) capacity and actual taxes collect

## Percent Distribution of Capacity

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, D. C.: ACIR, September 1983.

Shows the share of potential tax revenues attributable to each tax source for the state, and U.S. average.

## Amounts Per Capita

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, D.C.: ACIR, September 1983.

State and U.S. tax capacity and revenue are expressed in per-capita amounts.

## Tax Categories

Source: Advisory Commission on Intergovernmental Relations. 1981 Tax Capacity of the Fifty States. Washington, D. C.: ACIR, September 1983.

General Sales - Sales and gross receipts for retail trade and service businesses, such as hotels, personal services, and amusement establishments.

Selective Sales - Taxes on sales and gross receipts for motor fuels, alcoholic beverages, tobacco products, insurance, public utilities, parimutuel turnover from horse and dog racing, and amusement-related receipts such as from movie theaters.

Licenses - Taxes on motor vehicles, motor-vehicle operators, for incorporation of businesses, retail licenses for the sale of distilled spirits, and hunting and fishing licenses.

Individual Income - Taxes on individuals measured by income and taxes distinctly imposed on special types of income (e.g., interest, dividends, intangibles).

Corporate Net Income - Corporate income allocated among states based on three factors: retail receipts, payroll, and corporate property. Typically, equal weights (one-third) are applied to each of these factors. However, data for corporate property and sales by state were not available, and proxies were used to estimate

these factors in the formula for each industry. Payroll data, by industry, by state, and retail sales data formed the basis for the proxies that were utilized.

Property Tax - The property taxes are separated into four different components—residential, commercial, farm, and public utilities—each of which was estimated separately. Three classes are reported separately in this study: residential, commercial, and farm.

- a) Residential Estimated sales value of specified owner and renter-occupied property.
- b) Commercial and Industrial Estimated net book value of depreciable assets, inventories, depletable assets, and land of corporations.
- c) Farm Real Estate Estimated value of farm land and buildings.
- d) Public Utilities Gas-utility plant values allocated among states according to miles of gas pipeline, telephone plant values allocated among states according to number of telephones, and electric-plant values allocated among states according to electrical generating capacity in kilowatts. Public utilities are not separately reported but are included in the total.

Death and Gift - Value of taxable estate.

Severance - Taxes imposed distinctively on the removal of natural products -- e.g., oil, gas, and other minerals. This is not a measure of reserves.

# SECOND AND THIRD DATA PAGES PUBLIC AND INDEPENDENT INSTITUTIONS: STATUS REPORT

Sections: State and Local Finances

Abstracted from first data page - for public and independent institutions separately.

## Section: Public Enrollments

## High School Graduates

Source: NCES. "1980-81 Public and nonpublic high school graduates from regular programs excluding equivalency certificates and graduates from other programs." Unpublished data, NCES, Washington, D. C.

Headcount of persons graduating from regular public high schools and from private schools. Does not include persons granted high school equivalency certificates nor persons graduated from other than regular day-school programs.

## Entrance Rate to Public Institutions

Source: Derived measure.

Calculated by dividing first-time resident enrollment by high school graduates. This is a derived number and does not indicate the actual progression of a cohort of high school students to state public institutions that a longitudinal study could show.

## First-time Resident Enrollment

Source: (1) NCES. HEGIS XVI: Fall Fnrollment in Institutions of Higher Education, 1981. Washington, D.C.: NCES, 1981. (Magnetic Tape) and (2) NCES. HEGIS XIV: Residence and Migration of College Students, Fall 1979. Washington, D.C.: NCES, 1979. (Magnetic Tape); or special survey of states conducted by the authors in May 1983 entitled, "Survey of Selected Funding and Financing Practices for Postsecondary Education," Boulder, Colo., 1983.

The percentage of residents of total headcount enrollments for each institutional classification was calculated using student-migration data. Total first-time headcount enrollment was

multiplied by these percentages to equal first-time resident enrollment for each institutional category. The sum of these institutional-category enrollments equals the state's total public first-time resident enrollment.

## In-migration to Public Institutions

Source: (1) NCES. HEGIS XVI: Fall Enrollment in Institutions of Higher Education, 1981. Washington, D. C.: NCES, 1981. (Magnetic Tape), and (2) NCES. HEGIS XIV: Residence and Migration of College Students, Fall 1979. Washington, D. C.: NCES, 1979. (Magnetic Tape); or special survey of states conducted by the authors in May 1983 entitled, "Survey of Selected Funding and Financing Practices for Postsecondary Education," Boulder, Colo., 1983.

The number of first-time students coming from out of state is calculated by subtracting first-time resident enrollment from total first-time enrollments.

## First-time Enrollment

Source: NCES. HEGIS XVI Fall Enrollment in Institutions of Higher Education, 1981. Washington, D.C.: NCES, 1981. (Magnetic Tape.)

Ţ,

First-time resident enrollments plus first-time students from out of state.

## Retention Factor

Source: Derived measure.

Total public headcount enrollment divided by first-time headcount enrollment. This factor converts first-time to total enrollment.

## Conversion Factor

Source: Derived measure.

550

1)76

Full-time-equivalent enrollment divided by total public headcount enrollment. This factor converts headcount to FTE enrollment.

## FTE Enrollment

Source: NCES. HEGIS XVI: Fall Enrollment in Institutions of Higher Education, 1981. Washington, D.C.: NCES, 1981. (Magnetic Tape.)

Sum of full-time men plus full-time women plus a full-time equivalent of part-time students (as reported by institutions)—that is, line 14, columns 13 and 14; and line 28, column 15 on the survey form. (For institutions that do not report the FTE of part-time students, FTE is calculated by summing part-time men and part-time women and dividing by three.)

## Section: Institutional Revenues

## State and Local Appropriations

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Appropriations equal the sum of Part A, lines 3 and 4, of the HEGIS finance survey. Grants or contracts are excluded. Dollars appropriated or made available by state and local governments to public or private institutions of higher education for current operating expenses and not for scientific projects or programs. Federal appropriations received through state channels should be included in the total for federal appropriations. Tuition and fees collected by the institution and returned to the institution in the form of appropriations (that is, reappropriated tuition and fees) should have been

subtracted, as they are already reported under tuition and fees.

## Tuition Revenues .

Source: NCES: HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part A, line 1, of the HEGIS finance survey. All tuition and mandatory fees assessed against students for current operating purposes. Includes tuition and fee remissions or exemptions even when there is no intention of collecting from the student. Includes those tuitions and fees that are remitted to the state as an offset to the state appropriations. (Charges for room, boar 1, and other services rendered by auxiliary enterprises are not reported here.)

## Private Gifts, Grants, and Endowment Income

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part A, lines 11, 12, 13, and 14, of the HEGIS finance survey. Private gifts and grants include revenues from private donors for which no legal consideration is involved. Private contracts include those funds for which specific goods and services must be provided to the funder as stipulation for receipt of the funds. Includes only those gifts, grants, and contracts that are directly related to instruction, research, or public service. Monies received as a result of gifts, grants, or contracts from a foreign government are included. Endowment income includes the unrestricted income of endowment and similar funds; the restricted income of endowment and similar funds to the extent expended for current operating purposes;

and income from funds held in trust by others under irrevocable trusts. Capital gains or losses are not included.

## Other E&G (Excluding Government Contracts)

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part A, lines 2, 15, and 18, of the HEGIS finance survey. Includes revenues from federal appropriations, sales and services of educational activities, and "other," Federal appropriations include all amounts received from or made available to the institutions through an act of Congress, except grants or contracts. These funds are for meeting the current operating expenses and not for specific projects or programs. Examples are federal land-grant appropriations and federal revenue-sharing funds. BEOGs should not be included. Sales and services of educational activities include revenues derived from the sale of goods and services that are incidental to the conduct of instruction, research, or public service. Examples include film rentals, scientific and literary publications, testing services, university presses, and dairy products. "Other" sources includes all items of revenue not covered elsewhere. Examples are interest income and gains (net of losses) from investments of unrestricted current funds. Includes revenues resulting from the sales and services of internal service departments to persons or agencies external to the institution.

## Total E&G (Excluding Government Contracts)

Source: NCES. HEGIS XVII. Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part A, the sum of lines 1, 2, 3, 4, 11, 12, 13, 14, 15, and 18. This is the same definition as for Total E&G revenues, except government grants and contracts are excluded.

## Government Grants and Contracts

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part A, the sum of lines 5, 6, 7, 8, 9, and 10, of the HEGIS finance survey. Includes revenues from governmental agencies (federal, state, and local), that are for specific research projects or other types of programs such as student aid. Examples are research projects, training programs, and similar activities for which amounts are received or expenditures are reimbursable under the terms of a government grant or contract. Includes indirect costs recovered.

Faculty counts are taken from the following source: NCES. HEGIS XVI: Salaries, Tenure, and Fringe Benefits of Full-time Instructional Faculty, 1981-82 Washington, D. C.: NCES, 1981. (Magnetic Tape.)

Headcount of instructional faculty on 9-to 10-month contracts. Does not include faculty on 11-to 12-month contracts. If significant numbers of faculty are so employed, these figures will be overstated due to the undercounting of faculty.

## Total E&G Revenues

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part A, the sum of lines 1 through 15, and 18. Consists of current funds revenues from state and local appropriations; tuition income; government grants and contracts; private gifts, grants, and endowment income; sales and services of educational activities; and other revenues. Excluded from E&G revenues are income from sales and services of auxiliary enterprises, sales and services of hospitals, independent operations, and revenues for capital purposes. E&G funds include only those funds intended for operating purposes.

## Percent Distribution: Institutional Revenues

Source: Derived measure.

This measure shows the share of revenues provided by each source. The next-to-last column is an intermediate total, with the final share contributed by government grants and contracts.

## Section: Institutional Expenditures

## Instruction

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part B, line 1. Instruction expenditures of the colleges, schools, departments, and other instructional divisions of the institution, and expenditures for departmental research and public service that are not separately budgeted, should be included in this classification. Includes expenditures for both credit and noncredit activities. Excludes expenditures for academic administration where the primary function is administration (for example, academic deans). This category includes the following: general academic instruction; occupational and vocational instruction;

special-session instruction; community education; preparatory and adult basic education; and remedial and tutorial instruction.

## Academic Support

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part B, line 4. Academic support includes expenditures for the support services that are an integral part of the institution's primary missions of instruction, research, or public services. Includes expenditures for libraries, museums, galleries, audiovisual services, academic computing support, ancillary support, academic administration and personnel development, and course and curricular development.

## Research

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part B, line 2. Research includes all funds expended for activities specifically organized to produce research outcomes and commissioned by an agency either external to the institution or separately budgeted by an organizational unit within the institution. Does not include nonresearch projects (such as training programs).

Faculty counts are taken from the following source: NCES. HEGIS XVI: Salaries, Tenure, and Fringe Benefits of Full-time Instructional Faculty, 1981-82. Washington, D. C.: NCES, 1981. (Magnetic Tape.)

552

 $\frac{1}{\mathrm{RIC}}J_{\mathrm{S}()}$ 

Headcount of instructional faculty on 9to 10-month contracts. Does not include faculty on 11- to 12-month contracts. If significant numbers of faculty are so employed, these figures will be overstated due to the undercounting of faculty.

## Public Service

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part B, line 3. Public service includes all funds budgeted specifically for public service and expended for activities established primarily to provide noninstructional services that are beneficial to groups external to the institution. Examples are seminars and projects provided to particular sectors of the community. Includes expenditures for community services and cooperative extension services.

## Other E&G Expenditures

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part B, lines 6, 7, 8, 9, 10, and 11. Includes student services, institutional support, operation and maintenance of plant, scholarships and fellowships, and E&G mandatory transfers. For complete definitions, please see the HEGIS finance form.

## Total E&G Expenditures

Source: NCES. HEGIS XVII: Fi incial Statistics of Institutions of Higher Education for Fiscal Year Ending 1>82. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Part B, line 12. Educational and general expenditures include current fund expenditures for instruction, research, public service, academic support, student services, institutional support, operation and maintenance of plant, scholarships and fellowships, and educational and general mandatory transfers. Educational and general expenditures exclude expenditures for auxiliary enterprises, hospitals, and independent operations.

## FOURTH DATA PAGE - TRENDS

## Section: State and Local Appropriations Diagram

## Dollars

Source: NCES. HEGIS XIII-XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1978-1982. Washington, D.C.: NCES, 1978-1982. (Magnetic Tape.)

Shows graphically the percentage change in state and local appropriations to public institutions between 1978 and 1982.

#### Enrollments

Source: NCES. HEGIS XII-XVI: Fall Enrollment in Institutions of Higher Education, 1977-1981. Washington, D. C.: NCES, 1977-1981. (Magnetic Tape.)

Shows graphically the percentage change in public FTE enrollments between 1977 and 1981, the relevant academic period corresponding to the fiscal-year data used in this report.

## Constant Dollars per Student

Source: "Higher Education Prices and Price Indexes: 1983 Update." Research Associates of Washington, Washington, D. C., September 1983.

Takes the foregoing data on appropriations and enrollments and adjusts for inflation, using the Higher Education Price Index (HEPI). The HEPI measures average changes in the prices of goods and services purchased by colleges and universities through current fund E&G expenditures (excluding expenditures for sponsored research and auxiliary enterprises). The following table shows the index values used and the percentage increase for the years of this study.

Year	HEPI	HEPI Increase	
1978	156.5	1978-82 44.3X	
1979	168.7	1981-82 10.0% 1971-100	
1980	185.3	1980-81 10.8X	
1981	205.2	1979-80 9.8X	
1982	225.8		

## Section: Enrollment Mix Pie Diagram

Source: NCES. HEGIS XII and XVI: Fall Enrollment in Institutions of Higher Education, 1977 and 1981. Washington, D.C.: NCES, 1977 and 1981. (Magnetic Tape.)

Using the institutional classification system described in appendix A, the distribution of enrollments by institutional type in the public and private sectors are calculated and shown separately for 1981 and for 1977. 1977 figures are in parentheses.

## Section: State and Local Appropriations and Enrollments

These measures are the same as those shown previously, except in this section the absolute amounts for 1982 for appropriations (and for fall 1981 for enrollments) are shown, along with percentage change for the four-year period 1978 to 1982 and for yearly changes for 1981 to 1982, 1980 to 1981, and 1979 to 1980.

## Section: A Comparison of Tuition Revenues and Instruction Expenditures

These data are the same as those shown on the second and third data pages for tuition revenues and instruction expenditures. The base measures are shown in constant dollars per student. The solid white column shows the dollars per student for instruction expenditures and the cross-hatched column shows the tuition-revenue dollars per student. The percentages at the bottom of each box show the proportion of instruction expenditures that tuition represents in FY78 and FY82.

## FIFTH DATA PAGE - TRENDS

## Section: Constant-Dollar Revenues

The revenue categories in this section are the same as those used in the status report pages (second and third data pages). The per-student amounts have been adjusted by the HEPI to provide constant-dollar amounts. The percent changes between 1978 and 1982, as well as individual yearly changes for 1981-82, 1980-81, and 1979-80, are shown in total by sector and for each institutional category.

## Section: Trends in the Mix of Support for Higher Education

The bar graphs show individually for the public and independent sectors the mix of support for the following sour es: state and local appropriations, tuition revenues, government grants and contracts, private gifts, grants and endowment income, and "other" E&G revenues. The solid white column represents FY78 and the cross-hatched column is for FY82.

## SIXTH DATA PAGE -FACULTY SALARIES

## **Average Faculty Salaries**

Source: NCES. HEGIS XVI: Salaries, Tenure, and Fringe Benefits of Full-time Instructional Faculty, 1981-82. Washington, D. C.: NCES, 1981. (Magnetic Tape.)

Part 1, A, lines 1, 2, 3, 4, 5, and 6. Instructional faculty are defined as those members of the instruction/research staff who are employed on a full-time basis, on 9- to 10- month contracts, whose major regular assignment is instruction, including those with released time for research. Instructional faculty on sabbatical leave are to be included at their regular salaries even though they may be receiving a reduced annuity while on leave. Replacement for those on sabbatical should not be included. Total salary outlay for each rank is divided by the headcount of full-time persons at that rank.

## SEVENTH AND LAST DATA PAGE -INSTITUTIONAL DESCRIPTORS AND DATA NOTES

## Number of Institutions

Source: NCES. HEGIS XVII: Financial Statistics of Institutions of Higher Education for Fiscal Year Ending 1982. Washington, D. C.: NCES, 1982. (Magnetic Tape.)

Count of institutions in each category, based on the institutional classification system described in appendix A.

## Mean Size of Institutions

Source: NCES. HEGIS XVI: Fall Enrollment in Institutions of Higher Education, 1981. Washington, D.C.: NCES, 1981. (Magnetic Tape.) Cumulative FTE enrollment for institutions in each category is divided by the number of institutions in that category.

## Total FTE Enrollment

Source: NCES. HEGIS XVI: Fall Enrollment in Institutions of Higher Education, 1981. Washington, D. C.: NCES, 1981. (Magnetic Tape.)

Fall 1981 enrollment is the relevant base for FY82 financial data. The cumulative enrollment of all institutions in that category.

## Percent of Enrollment by Student Level

Source: NCES. HEGIS XVI: Fall Enrollment in Institutions of Higher Education, 1981. Washington, D.C.: NCES, 1981. (Magnetic Tape.)

Based on FTE counts. Lower division includes the sum of first-time freshmen, other first-year and second-year undergraduate students. Upper division includes the sum of third-year and fourth-year and beyond. Unclassified undergraduate and postbaccalaureate undergraduate students are combined. Graduate includes first-professional students plus graduate-student totals. Note that part-time undergraduate students are classified as lower division since the survey does not provide a breakdown by level.

## Data Notes

Source: NCES. HEGIS XVII: State Expenditures for Postsecondary Education for Fiscal Years Ending 1981 and 1982. Washington, D. C.: NCES, 1983; and/or special survey of states conducted by the authors in May 1983 entitled, "Survey of Selected State Funding and Financing

⁵⁵⁴1 184

Practices for Postsecondary Education," Boulder, Colo., 1983.

"Additional State and Local Government Funding for Higher Education" reports the absolute-dollar amounts that are the basis for the "State and Local Government Support of Higher Education" table on the first data page. The second section of these data notes, "Clarification of Institutional Financial Reporting," provides additional clarifications on reporting practices in the states. A general "Other Comments" section follows to allow for clarification of special circumstances affecting the data analysis in the state. The sources of these data notes are noted at the bottom of this section.

# Section Two: Important Data Cautions

The value of this study is highly dependent on the accuracy of the data. The data used (primarily finance and enrollment data collected by the National Center for Education Statistics) are the best comprehensive data available. However certain limitations exist and should be kept in mind for proper usage and interpretation of the data. To the extent that they have been reported to NCES or to the authors. these limitations have been documented in the "Data Notes" for each state and should be taken into account in any interpretations. Other problems recognized by readers and not identified here should be brought to the authors' attention.

## Inclusion of Institutions

The HEGIS universe excludes postsecondary public and proprietary-area vocational-technical institutions that are not accredited by a nationally recognized accrediting body. For states with many postsecondary institutions of this type, enrollments and state appropriations reported in this study for the collegiate universe are presented in the "Data Notes" section as total amounts only. These institutions, however, are not included in the detailed institutional categories. Fourteen states reported current operating expenditures for public postsecondary vocational-technical institutes not in the NCES-HEGIS universe. These expenditures ranged from a low of approximately \$340 thousand to \$98 million. On average, these states spent \$26.1 million on postsecondary vocational-technical education.

## Treatment of Central Administration Costs

Revenues and expenditures for administration at campus system offices are

included in the finances for the parent institution. In states where administration is provided by a state postsecondary commission, similar administrative costs are not included. As a result, revenues and expenditures for these latter systems are somewhat understated. Many states had such expenditures, ranging from approximately \$77 thousand to \$16 million.

## Chargebacks and Central Payment of Employee Benefits

For some large university systems, a single campus may provide services to other campuses. If some form of chargeback system is not used, then the finances for the campus providing the service will be overstated, and finances for the campuses receiving services will be understated. In other cases, employee benefits are paid to a separate agency handling such funds, and consequently, they do not flow through institutional accounts. Approximately 14 states had expenditures in these categories.

## Counts of FTE Students

The HEGIS fall-enrollment survey does not establish a standard definition for "full-time-equivalent student." To the extent that institutions use different formulas, their FTE enrollment data lack comparability. And since FTE enrollment is used as a denominator for many indexes in this study, lack of comparability is a serious problem. However, it is believed that most institutions use similar bases for determining FTE enrollment, thereby likely reducing the seriousness of these inconsistencies.

Further problems are caused because not all institutions count enrollments on the same calendar date. Also the enrollment count is for the fall term and not the entire year. In contrast, finance data covers the entire fiscal year. Institutions with low attrition or large numbers of summer students will

therefore show per-student revenues and expenditures that are overstated relative to institutions in the opposite situation. Finally, the financial data reflect noncredit instructional and other expenditures; however noncredit enrollments are not reported.

## **Debt Service**

In some states, the capital costs of physical facilities are financed through a separate state agency; in other states, debt service is paid with current funds. For those that pay with current funds, their expenditures will be overstated in comparison to other states. Nineteen states had debt service funds appearing as state appropriations, and 10 states had such funds included in tuition and fees.

## Tuition Remissions

In some states, tuition and fees are remitted to the state as an offset to state appropriations. Although the HEGIS finance survey directions clearly specify that these funds should be reported under tuition and fees and not under state appropriations, there is uncertainty as to whether these directions have been strictly followed. Appropriations may be overstated in some states if remitted tuition and fees are not excluded.

Tuition and fee remissions and exemptions for students should be reported under tuition and fees revenues. If not, the amounts will be understated.

Eleven states reported tuition and fees being reappropriated by the legislature. A spot check in selected states indicated that institutions were properly following instructions for reporting tuition.

## Variances in Public Service

Institutions vary in the types of public-service activities they engage in. In many states, a variety of other state agencies may be providing these services (instruction in public hygiene, indigent patient care, hygiene research). To the extent that atypical state appropriations for these activities are reported, general institutional support will be overstated.

## Geographical Price Adjustments

No attempt has been made in this study to adjust dollar values for differences among states in the prices paid for equivalent goods and services for higher education. Geographical price differences do exist and they are substantial, ranging from perhaps as high as 30 to 40 percent above the national average in Alaska to 15 to 20 percent below the average in certain nonmetropolitan areas of the country. In establishing a basis for interstate comparisons of purchasing power, such price differences should be taken into account. However, these data are not currently available.

## Imputed Data

In some instances where institutions fail to report data, NCES imputes these numbers. The attached listing indicates by state, those institutions where one or more values in the finance data base were imputed.
